PREFACE

THE Handbook of Chemistry and Physics, continuing the policy of the past, is being revised at frequent intervals.

The general features and scheme of arrangement, which have received extensive endorsement in former editions have been retained. The aim throughout has been to present in condensed form as large an amount of accurate, reliable and up-to-date information in the fields of chemistry and physics as was consistent with convenience in form and the possibility of wide utility and distribution. A very large proportion of the tables have been compiled especially for the Handbook from various authoritative collections of data and from the current journals.

Since the beginning special consideration has been given to the requests and suggestions of those who have used former editions. In this way it has been hoped to develop the book along lines most acceptable to those interested in a volume of this type. Suggestions and contributions are received each year from many eminent chemists and physicists including members of the teaching profession and those engaged in industrial work. We believe this coöperation to have been of very great value in the growth and development of the work.

An attempt has been made to include material on all branches of chemistry and physics and the closely allied sciences, which would be likely to find any extended use. On the other hand, in order to retain the convenience of moderate dimensions and at the same time allow for natural growth due to the extension of knowledge in these sciences, and logical additions along lines already developed, it has seemed necessary to exclude types of material of use only in certain highly specialized lines of work.

Chemistry and physics, always closely related sciences, have been brought into much more intimate relations by the more recent developments of research. To an increasing extent the student of either science should have a knowledge of the other. It would seem that there should be a large field for a single volume containing the constants and formulæ of the two sciences together with mathematical and conversion tables adequate for

accurate computation. The generous response which the previous editions have met indicates that the volumes have been found useful and it is with the hope of even more completely meeting the needs of the chemists and physicists of the English-speaking world that succeeding editions are offered.

CHEMICAL RUBBER PUBLISHING CO.

CLEVELAND, OHIO

PREFACE TO THE TWENTY-FIRST EDITION

The Twenty-First Edition of the Handbook of Chemistry and Physics represents an increase in number of pages over the preceding edition of only 64. There are, however, over 175 pages of new composition entailed by complete revision of several important tables.

The mathematical section presents several new features. The numerical table of former editions has been replaced by a new and improved form. It now appears in two parts, the first of which gives the reciprocals and the circumference and the area of circles. The second part is devoted wholly to squares, cubes and roots, and all values are given to at least seven significant figures. The square roots of $10n$ and the cube roots of $10n$ and of $100n$ are included.

A table of haversines and considerable material on statistics have been added, and the order of arrangement altered so as to place the four- and five-place logarithm tables at the front of the volume.

The collection of laboratory arts and recipes has been completely revised and enlarged by material sent in by a large number of contributors in charge of or associated with educational or commercial laboratories.

The photographic section has been much enlarged and includes a large variety of new formulae and a completely revised table of plate and film speeds given in the Scheiner and in the Weston systems.

The increasing availability and widespread utilization of commercial plastics makes particularly appropriate the new and unusually complete collection of data for this class of material. The table occupies 17 pages and covers a very wide range of properties.

PREFACE TO THE TWENTY-FIRST EDITION

A revised table of isotopes brings up to date the information in this rapidly changing field.

Increased convenience in the reduction of gas volume to standard conditions will result from the use of the new special table giving both the factors and their logarithms for such reductions.

Several other small tables have been added and a large number of minor changes and partial revisions have been made.

COLLABORATORS AND CONTRIBUTORS

ALBRIGHT, J. G., Ph.D. Assistant Professor of Physics, Case School of Applied Science.

ALLEN, S. J. M., Ph.D. Professor of Experimental Physics, University of Cincinnati.

ANDREWS, ANDREW IRVING, Ph.D. Associate Professor of Ceramic Engineering, University of Illinois.

ASHLEY, R. H., Ph.D. Professor of Chemistry, The St. Lawrence University.

BAXTER, ROBERT A., M.A. Associate Professor of Chemistry, Colorado School of Mines.

BENFORD, FRANK, B.E.E. Research Laboratory, General Electric Company, Schenectady, New York.

CORK, JAMES M., Ph.D. Associate Professor of Physics, University of Michigan.

CURRIE, LAUCHLIN M., Ph.D. National Carbon Company, Inc., Cleveland, Ohio.

DEMING, H. G., Ph.D. Professor of Physical Chemistry, University of Nebraska.

DUNN, MAX S., Ph.D. Associate Professor of Chemistry, University of California at Los Angeles.

GASKILL, H. V., Ph.D. Associate Professor of Psychology, Iowa State College.

HALE, HARRISON, Ph.D. Professor and Head of the Chemistry Department, University of Arkansas.

HARKINS, WILLIAM D., Ph.D. Professor of Chemistry, University of Chicago.

HARTMAN, W. W., Ph.D. Department of Synthetic Chemistry, Eastman Kodak Company, Rochester, New York.

HAYNES, F. B., M.S. Associate Professor of Physics, Virginia Polytechnic Institute.

JORDAN, CHARLES NEAL, Ph.D. Assistant Professor of Chemistry, St. Louis University School of Medicine.

KOEHLER, WALTER A., Ph.D. Associate Professor of Chemical and Ceramic Engineering, West Virginia University.

LEWIS, HOWARD BISHOP, Ph.D. Professor of Physiological Chemistry, Director of the College of Pharmacy, Medical School, University of Michigan.

LYONS, EDWARD, Ph.D. Research Laboratories, Parke, Davis & Company, Detroit, Michigan.

MARTIN, JOHN R., M.S. Assistant Professor of Electrical Communication, Case School of Applied Science.

MARVEL, C. S., Ph.D. Professor of Organic Chemistry, University of Illinois.

MASON, THOMAS W., M.S. Associate Professor of Analytical Chemistry, Penn. State College.

PARKER, CHARLES B. U. S. Patent Office, Washington, D. C.

PATTERSON, AUSTIN M., Ph.D. Professor of Chemistry and Vice President, Antioch College.

PETERS, F. N., Ph.D. Furfural Division, Quaker Oats Corporation, Chicago, Illinois.

POST, HOWARD W., Ph.D. Assistant Professor of Chemistry, The University of Buffalo.

RANDALL, MERLE, Ph.D. Professor of Chemistry, University of California.

RENNERFELT, IVAR. Electro-Metallurgist, Stockholm, Sweden.

ROBERTS, ROBERT C., Ph.D. Professor of Chemistry, Colgate University.

SHEELY, M. L. Chief Chemist, Armour Soap Works, Chicago, Illinois.

SHEPPARD, ODEN E., Ph.D. Associate Professor of Chemistry, Montana State College.

SHIPMAN, CHARLES H. The Dodd Company, Cleveland, Ohio.

SWEENEY, ORLAND RUSSEL, Ph.D. Professor and Head of the Department of Chemical Engineering, Iowa State College.

TURRILL, PARK L. Department of Chemistry, Glendale Junior College.

WENIGER, W., Ph.D. Professor and Head of Department of Physics, Oregon State Agricultural College.

WESTMAN, A. E. R., Ph.D., F.C.I.C. Director of Chemical Research, Ontario Research Foundation, Toronto, Canada.

WIGREN, NILS. Instructor of Analytical Chemistry, University of Upsala, Upsala, Sweden.

YOE, JOHN H., Ph.D. Professor of Chemistry, University of Virginia.

YOUNG, THOMAS F., Ph.D. Associate Professor of Chemistry, University of Chicago.

The Publishers and Editor will be grateful to readers of this Handbook who will call their attention to errors which may be discovered. Suggestions for improvement are also welcome.

CONTENTS

MATHEMATICAL TABLES

PROPERTIES AND PHYSICAL CONSTANTS

GENERAL CHEMICAL TABLES

SPECIFIC GRAVITY AND PROPERTIES OF MATTER

HEAT

PAGE

LIGHT

QUANTITIES AND UNITS

Sodium Hydroxide or Potassium Hydroxide.—Vinegar, lemon juice, orange juice, oil, milk.

Sulfuric Acid.——Same as for hydrochloric acid with the addition of soap or oil.

Sulfurous Acid or Sulfur Dioxide.—Mustard plaster on chest; narcotics, expectorants.

Wood Alcohol (Methyl Alcohol or Methanol).–Emetic or wash out stomach (stomach tube) with a solution of 10 grains sodium citrate per ounce of water. Give milk, white of egg or flour in water; purgative of magnesium sulfate (15 grams); stimulate and combat collapse. In case of cardiac or pulmonary failure use artificial respiration. Physicians may administer atropine, digitalin or strychnine as stimulants; to cause perspiration and elimination of the poison use 0.1 grain of pilocarpine hydrochloride.

BURNS AND SCALDS

Exclude air by thin paste of starch, flour, or baking soda. Ordinary oils such as vaseline, olive or castor oil, lard or cream may also be used. Lime water mixed with an equal part of raw linseed oil makes an excellent dressing. An especially valuable material for all burns is picric acid gauze which may be applied in the form of a compress.

After treatment with any of the above materials, cover with a cloth or with cotton and hold in place with a light bandage.

Apply a freshly prepared 5% tannic acid solution. Place several layers of sterile gauze over the burned area, saturate with the tannic acid solution and bandage loosely.

ACID AND ALKALI BURNS

With either, wash off as quickly as possible with a large quantity of water. Water from a tap may be allowed to flow over burns.

Acids

While the injury is being washed, have procured lime water or lime water and raw linseed oil mixed together in equal proportions or a mixture of baking soda and water or soap suds and apply freely. For acid in the eye wash as quickly as possible with water and then with lime water.

Alkalis

Wash with a large quantity of water as for acid burns. Neutralize with weak vinegar, hard cider or lemon juice. For lime or other strong alkali burns in the eye wash with weak solution of vinegar or with olive oil or a saturated solution of boric acid.

FIRE PRECAUTIONS AND CHEMICAL HAZARDS

Acetone.—Dilute with a spray of water to avoid spread of burning liquid. Use suitable gas mask.

Alcohol.—See under acetone.

Ammonia.—Use water and dilute acid. Use suitable gas mask.

Benzol or Benzene.—Use water to cool containers which are endangered; extinguish flame with sand, earth, fire-foam or carbon tetrachloride fire extinguishers. Use suitable gas mask.

Calcium Carbide.—Do not use water as this generates acetylene, an inflammable and explosive gas; cut off electric current to avoid ignition of gas. Remove containers to a dry place. Use gas mask.

Carbon Disulfide.—Use water to cool containers which are endangered; extinguish blaze with sand, earth, fire-foam or carbon tetrachloride fire extinguishers. Use suitable gas mask.

Carbon Tetrachloride.—Do not use a fire extinguisher filled with carbon tetrachloride (pyrene or carbona) on flames caused by an electrical short circuit in a confined space; the carbon tetrachloride may be decomposed into toxic gases.

Celluloid.—Use large volumes of water and sand. The smoke contains oxides of nitrogen which are injurious. Use suitable gas mask.

Chlorine.—Spray with water. The pungent nature of the gas makes the use of a gas mask imperative.

Collodion.—See under carbon disulfide.

Ether.—See under carbon disulfide.

Gasoline.—See under carbon disulfide.

Hydrochloric Acid.—Use large volumes of water also chalk or soda. Use gas mask.

Hydrocyanic or Prussic Acid.—Suitable gas mask is essential because of the extremely poisonous nature of the vapors. Provide ventilation.

Lacquer Solvents.—See under carbon disulfide.

Magnesium.—Do not use water. Use sand or earth to extinguish flames. Remove containers to a dry place.

Nitric Acid and Oxides of Nitrogen.—Use large volumes of water. Do not use sand or earth. Use gas mask.

Potassium.—Do not use water. Remove containers to a dry place. Extinguish flames with sand or earth. For storage, potassium is kept immersed in petroleum.

Potassium Hydroxide.—Use large volumes of water or dilute acids.

Phosphorus.—Use water and wet sand. Use gas mask. For storage, white phosphorus must be kept immersed in water. Red phosphorus is less dangerous.

Sodium.—See under potassium.

Sodium Hydroxide.—See under potassium hydroxide.

Sulfur.—Extinguish with water or sand. Use gas mask.

Sulfuric Acid.—See under hydrochloric acid.

Turpentine.—See under acetone.

MATHEMATICAL TABLES

USE OF MATHEMATICAL TABLES

For a complete discussion of the principles and use of mathematical tables, textbooks on the subject should be consulted. The following brief statements are intended to give only sufficient information to make possible the intelligent use of the tables, omitting for the most part any attempt at treating the theory and principles.

Exponential Method of Expressing Numbers—For convenience in writing and manipulation, numbers are often expressed as factors of appropriate powers of 10. The following examples will illustrate:

2,380,000,000.	may be written	2.38×10^9
238.	may be written	2.38×10^2
.238	may be written	2.38×10^{-1}
.000000238	may be written	2.38×10^{-7}

Logarithms—The logarithm of a number is the exponent of that power to which another number, the base, must be raised to give the number first named. Any positive number greater than 1 might serve as a base. Two have been selected, yielding two systems of logarithms. One base, 2.718 . . . . usually indicated by the letter e, gives rise to a system of logarithms convenient in higher mathematics. These are called natural, Napierian, or hyperbolic logarithms. Reference will be made to their use in a subsequent paragraph.

The other base used is 10, giving logarithms particularly adapted to use in computation, called common or Briggian logarithms. Tables of logarithms given without designation are invariably of this latter type.

Since most numbers are incommensurable powers of ten, a common logarithm, in general, consists of an integer which is called the characteristic and an endless decimal, the mantissa.

It is to be observed that the common logarithms of all numbers expressed by the same figures in the same order with the decimal point in different positions have different characteristics but the same mantissa. To illustrate:—if the decimal point stand after the first figure of a number, counting from the left, the characteristic is 0; if after two figures, it is 1; if after three figures, it is 2, and so forth. If the decimal point stand before the first significant figure the characteristic is -1, usually written $\bar{1}$; if there is one zero between the decimal point and the first significant figure it is $\bar{2}$ and so on. For example: $\log 256 = 2.40824$, $\log 2.56 = 0.40824$, $\log 0.256 = \bar{1}.40824$, $\log 0.00256 = \bar{3}.40824$. The two latter are often written $\log 0.256 = 9.40824 - 10$, $\log 0.00256 = 7.40824 - 10$.

A method of determining characteristics of logarithms is to write the number with one figure to the left of the decimal point multiplied by the appropriate power of 10. The characteristic is then the exponent used. For example:

$$256{,}000{,}000 = 2.56 \times 10^{8} \quad \log = 8.40824$$
$$0.000000256 = 2.56 \times 10^{-7} \quad \log = \bar{7}.40824 \text{ or } 3.40824-10$$

Inasmuch as the characteristic may be determined by inspection the mantissas only are given in tables of common logarithms.

To find the logarithm of a number:

For a number of four figures, take out the tabular mantissa on a line with the first three figures of the number and under its fourth figure. The characteristic is determined as previously explained.

For a number of less than four figures, supply zeros to make a four figure number and take the value of the mantissa from the tables as before. For example: log 2 = log 2.000 = 0.30103.

For a number of more than four figures, take the tabular value of the mantissa for the first four figures; find the difference between this mantissa and the next greater tabular mantissa and multiply the difference so found by the remaining figures of the number as a decimal and add the product to the mantissa of the first four figures. For example: to find log 46.762.

$$\log 46.76 = 1.66987$$

Tabular difference between this mantissa and that for 4677 is .00010.

$$\begin{aligned} \therefore \log 46.762 &= 1.66987 + .2 \times .00010 \\ &= 1.66987 + .00002 \\ &= 1.66989 \end{aligned}$$

To find the number corresponding to a given logarithm:

If the mantissa is found exactly in the table, join the figure at the top which is directly above the given mantissa to the three figures on the line at the left and place the decimal point according to the characteristic of the logarithm. For example, $\log^{-1}$ (antilogarithm) 3.39967 = 2510.

If the mantissa is not found exactly in the table it is necessary to interpolate. For example, $\log^{-1} 3.40028 = 2513. + {}^{9}/_{18} = 2513.5$.

The column of proportional parts at the right of each page of the table shows, under the heading of the various tabular differences, the parts of these differences which correspond to the digits from 1 to 9 in the fifth place. This makes it possible to take out a logarithm for a five figure number or to find an antilogarithm of the same number of significant figures with increased facility, usually by inspection.

The following formulae express the relations on which the use of logarithms is based:

$$\log ab = \log a + \log b$$

$$\log \frac{a}{b} = \log a - \log b$$

$$\log a^n = n \times \log a$$

$$\log \sqrt[n]{a} = \frac{\log a}{n}.$$

The following examples will serve as illustrations:

1. $52600 \times 0.00381 \times 2.74 = 549.1$

$$\begin{aligned} \log 52600 &= 4.72099 \\ \log 0.00381 &= \bar{3}.58092 \\ \log 2.74 &= 0.43775 \\ \hline \text{Sum:} &= 2.73966 \\ \text{Antilogarithm} &= 549.1 \end{aligned}$$

The sum is the logarithm of the product, the mantissa of which is 73966. On looking up this mantissa in the logarithm tables we see that it corresponds to the digits 5491. The characteristic is 2, hence there are three figures before the decimal point. The number corresponding to the logarithm, called the antilogarithm, is 549.1.

2. $0.00123 \div 52.7 = 0.00002334$ An Alternative method:

log 0.00123	$= \bar{3}.08991$	log 0.00123	$= 7.08991 - 10$
log 52.7	$= 1.72181$	log 52.7	$= 1.72181$
Subtracting	$\bar{5}.36810$		$5.36810 - 10$
Antilog	0.00002334		

The characteristic $\bar{5}$ (5. −10) shows four zeros after the decimal point before the first significant figure.

3. $\dfrac{273 \times 780}{292 \times 760} \times 15 \times 0.09 = 1.295$

log 273	= 2.43616	log 292	= 2.46538
log 780	= 2.89209	log 760	= 2.88081
log 15	= 1.17609	log denominator	= 5.34619
log 0.09	$= \bar{2}.95424$		
log sum	= 5.45858		

$$\begin{aligned} \text{log numerator} &= 5.45858 \\ \text{log denominator} &= 5.34619 \\ \hline \text{subtracting} &= 0.11239 \\ \text{antilogarithm} &= 1.295 \end{aligned}$$

As division may be accomplished by multiplying by the reciprocal of a number, the above may be considerably simplified. The logarithm of the reciprocal of a number, called the cologarithm, is readily obtained from the table by subtracting the logarithm of the number from zero. This may readily be read off from the table of mantissas. Change the sign of the characteristic algebraically adding to it -1, then mentally subtract each figure of the mantissa from 9 proceeding from left to right, the last figure being subtracted from 10. The example then is:

$$
\begin{array}{lrl}
\log & 273 & = 2.43616 \\
\log & 780 & = 2.89209 \\
\log & 15 & = 1.17609 \\
\log & 0.09 & = \bar{2}.95424 \\
\text{colog} & 292 & = \bar{3}.53462 \\
\text{colog} & 760 & = \bar{3}.11919 \\
\hline
 & & \ 0.11239
\end{array}
$$

4. $(0.00098)^4 = 9.224 \times 10^{-13}$

$$
\begin{array}{lrl}
\log 0.00098 & = \bar{4}.99123 & \\
 & 4 & \\
\hline
 & 3.96492 & (a) \\
\bar{4} \times 4 & \overline{16}. & (b) \\
\hline
\log (0.00098)^4 = & \overline{13}.96492 & \\
\text{antilog} = 9.224 \times 10^{-13} & & (c)
\end{array}
$$

An alternative method:

$$
\begin{array}{rl}
\log 0.00098 = & 6.99123-10 \\
 & 4 \\
\hline
 & 27.96492-40 \\
\text{or} & 7.96492-20 \\
\text{or} & \overline{13}.96492 \\
\text{antilog} = & 9.224 \times 10^{-13}
\end{array}
$$

In the above it will be noted that the mantissa is always positive hence the multiplication of the mantissa shown at (a) while (b) shows the multiplication of the characteristic. (c) is the algebraic sum.

5. $\sqrt[5]{492} = 3.455$

$\log 492 = 2.69197$

Dividing the logarithm by 5 gives as the logarithm of the root 0.53839 the antilogarithm of which is 3.455 both characteristic and mantissa being positive. When the characteristic is negative and not evenly divisible by the root to be taken a modification of the logarithm is necessary.

6. $\sqrt[3]{0.000372} =$

$$
\begin{array}{rll}
\log 3.72 \times 10^{-4} = & \bar{4}.57054 & (a) \\
= & 26.57054-30 & (b)
\end{array}
$$

dividing (b) by 3 gives $8.85685-10$ which may be written

$\bar{2}.85685$ and is the logarithm of the root sought, the antilogarithm of which is 0.07192.

7. $0.000372^{1.2} = 0.000076674$

$$
\begin{aligned}
\log 0.000372 &= \bar{4}.57054 \\
&\text{or } 6.57054-10 \\
&\qquad\qquad 1.2 \\
\hline
&\quad 7.88465-12 \\
\text{antilogarithm} &\ 0.000076674
\end{aligned}
$$

Four-Place Logarithms—This short table on two facing pages makes possible logarithmic computation precise to four significant figures, (three without interpolation). The mantissa is given complete and the proportional parts indicated for each line.

Four-Place Antilogarithms—Some computers prefer to use separate tables for determining antilogarithms; the table being entered from the margins with the logarithm and the number being found in the body of the table. Such a table is given to accompany the four-place logarithms.

Five-Place Logarithms—For computation involving five significant figures, (four without interpolation) the five-place table will be adequate. Since the first two figures will be the same for several lines of the table they are given in the first line only. The point at which these first two figures change is indicated by an asterisk. While space does not permit the proportional parts for each line, tables will be found for each tabular difference.

The supplementary table following the five-place logarithms, giving seven-place logarithms for numbers of five significant figures from 10,000 to 12,000 will be found convenient to increase precision and avoid the inconvenience of interpolation where the differences are large.

Logarithms of the Trigonometric Functions—Logarithms of the functions are given for each minute from 0-360°.

The quantity -10 is to be appended to all logarithms of the sine and cosine, to logarithms of the tangent from 0-45° and of the cotangent from 45-90°.

With degrees indicated at either side of the top of the page use the column headings at the top. With degrees stated at the bottom of the page use the column designations at the bottom.

With degrees at the left (top or bottom) use the minute column at the left, and with degrees on the right side of the page use the minute column at the right.

To illustrate the proper employment of headings for angles in the four quadrants—

log sin 6° 24′ = 9.04715 − 10	log sin 186° 24′ = 9.04715 − 10
log sin 83° 15′ = 9.99698 − 10	log sin 263° 15′ = 9.99698 − 10
log cos 96° 41′ = 9.06589 − 10	log cos 276° 41′ = 9.06589 − 10
log cos 173° 49′ = 9.99747 − 10	log cos 353° 49′ = 9.99747 − 10

For the accurate determination of values where the tabular differences are large, the values of CS and CT are given. The following equations indicate their use.

To find the logarithm of the functions of an angle:

For angles 0–3°	For angles 87–90°
$\log\sin\theta = \log\theta'' - CS$	$\log\cos\theta = \log(90° - \theta)'' - CS$
$\log\tan\theta = \log\theta'' - CT$	$\log\cot\theta = \log(90° - \theta)'' - CT$
$\log\cot\theta = \text{colog}\tan\theta$	$\log\tan\theta = \text{colog}\cot\theta$

To find the angle:

For angles 0–3°	For angles 87–90°
$\log\theta'' = \log\sin\theta + CS$	$\log(90° - \theta)'' = \log\cos\theta + CS$
$\log\theta'' = \log\tan\theta + CT$	$\log(90° - \theta)'' = \log\cot\theta + CT$

In the above expressions, θ'' and $(90° - \theta)''$ are used to indicate the value of the angles expressed in seconds. The values in the body of the table are the cologarithms and should be used as indicated above.

The values of the logarithms S and T are also given in a separate table. For these the following relations hold:

To find the functions of an angle.

$\log\sin\theta = \log\theta'' + S$	$\log\cos\theta = \log(90° - \theta)'' + S$
$\log\tan\theta = \log\theta'' + T$	$\log\cot\theta = \log(90° - \theta)'' + T$

To find the angle.

$\log\theta'' = \log\sin\theta - S$	$\log(90° - \theta)'' = \log\cos\theta - S$
$\log\theta'' = \log\tan\theta - T$	$\log(90° - \theta)'' = \log\cot\theta - T$

Where the values of CS and CT are given, the angles expressed in seconds are given in the supplementary column at the left.

The tabular differences are given under the headings "d" and "c.d.", the latter referring to the common difference for the tangent and cotangent. Tables of proportional parts ("P.P.") facilitate interpolation. At the bottom of each column will be found special proportional parts between the tabular differences for the tangent or cotangent and those for the sine or cosine. These are useful when one function is to be obtained directly from the other without determining the angle.

For example, suppose log tan θ is given as 9.67644 and log cos θ is required. The difference between the given logarithm and that given in the table, 9.67622 (opposite 25° 23′), is 22.

The tabular differences of the two logarithmic functions at this place are 32 and 6. In the proportional table for $\frac{6}{32}$, 22 corresponds to 4; this, subtracted from the tabular logarithmic cosine 9.95591, gives the required log cos θ = 9.95587.

The symbols $\bar{5}$ and $\dot{5}$ are used to indicate how the terminal 5 has been derived. For example, the logarithm 8.8307$\bar{5}$ is more fully given as 8.8307495 while the value 9.4082$\dot{5}$ is derived from 9.4082539.

Natural Trigonometric Functions—Values of the natural trigonometric functions of angles are given for each minute from 0–360°.

For degrees indicated at the top of the page use the column headings at the top. For degrees indicated at the bottom use the column indications at the bottom.

With degrees at the left of each block (top or bottom), use the minute column at the left and with degrees at the right of each block use the minute column at the right.

Natural Functions and their Logarithms are given for angles in degrees and tenths from 0 to 90 degrees.

Natural Functions and their Logarithms are given for angles in radians and hundredths, from 0 to 2 radians.

Haversines—Values of $(1 - \cos\theta)/2$ for angles between 0 and 180° are given to four significant figures. The four-place mantissas of the logarithms of the haversines are also given. The correct characteristic must be provided in each case.

The listed values of the haversines were derived from values which were computed to seven significant figures. The logarithms were independently derived from the more exact values of the haversines and are, therefore, in many cases not the exact value of the logarithm of the haversine as listed. This is notably true at the beginning of the table where the logarithm can be given with more exactness than the function.

Natural Logarithms—The natural logarithms of numbers are presented in a group of tables. To find logarithms not included in the tables, the following method is used:

To find the logarithm of a number which is $\frac{1}{10}$ or 10 times etc. a number whose logarithm is given, subtract from or add to the given logarithm the logarithm of 10.

$$\text{Thus } \log 1.6 = \log 16 - \log 10$$
$$\log 160 = \log 16 + \log 10 \text{ etc.}$$

Table **A** gives logarithms of numbers from 0.00 to 0.99. −10 should be appended to each. For instance: $\log_e 0.48 = 9.266 - 10$

Table **B** gives logarithms of numbers from 1.00 to 10.09. For example: $\log_e 4.86 = 1.58104$

Table **C** gives logarithms of numbers from 10 to 99. For example: $\log_e 48 = 3.87120$

Table **D** gives logarithms of numbers from 100 to 1109. For example: $\log_e 486 = 6.18621$

Exponential Functions—Values of e^x, $\log e^x$ and e^{-x} where e is the base of the natural system of logarithms 2.71828 . . . and x has values from 0 to 10. Facilitating the solution of exponential equations, these tables also serve as a table of natural or Naperian antilogarithms. For instance if the logarithm or exponent $x = 3.26$ the corresponding number or value of e^x is 26.050. Its reciprocal e^{-x} is .038388.

Hyperbolic Functions—The table gives the values and logarithms of the hyperbolic sine x, cosine x, tangent x and cotangent x for values of x from 0 to 5.

Degrees-Radians—This table gives the value in radians to five significant figures; for each 10 minutes from 0° 0′ to 90° 0′; for each degree from 90 to 180; for each 10 degrees from 180 to 480. Values are also given for each minute from 0–60′ and for each second from 0–60″.

Tables are also provided to facilitate changing from degrees and decimal fractions to radians, from decimal fractions of a degree to minutes and seconds and the reverse operations.

Numerical Tables—The first section gives the reciprocals of numbers from 0 to 1000 and circumferences and areas of circles with diameters having these values. Reciprocals and circumferences for values not listed can be obtained by an appropriate shift of the decimal point.

The second section is devoted to squares, cubes and roots. The squares and cubes from 1 to 1000 are given exactly. The roots are given to seven significant figures. Since the square roots of $10n$ are given, values of the square roots from 1 to 10,000 may be found directly. For the square roots of numbers below and above this range, use may be made of the following relations: $\sqrt{100n} = 10\sqrt{n}$; $\sqrt{1000n} = 10\sqrt{10n}$; $\sqrt{\frac{1}{10}n} = \frac{1}{10}\sqrt{10n}$; $\sqrt{\frac{1}{100}n} = \frac{1}{10}\sqrt{n}$; $\sqrt{\frac{1}{1000}n} = \frac{1}{100}\sqrt{10n}$. For example, the square root of 0.268 may be found by using the form, $\sqrt{0.268} = \frac{1}{100}\sqrt{10 \times 268}$. The tabular value for the square root of $10n$ for 268 is 51.76872. Hence, the desired root is 0.5176872.

Values of cube roots for all numbers from 1 to 100,000 will be found directly in the table. Cube roots for numbers above or below this range will be found from the following relations: $\sqrt[3]{1000n} = 10\sqrt[3]{n}$; $\sqrt[3]{10{,}000n} = 10\sqrt[3]{10n}$; $\sqrt[3]{100{,}000n} = 10\sqrt[3]{100n}$; $\sqrt[3]{\frac{1}{10}n} = \frac{1}{10}\sqrt[3]{100n}$; $\sqrt[3]{\frac{1}{100}n} = \frac{1}{10}\sqrt[3]{10n}$; $\sqrt[3]{\frac{1}{1000}n} = \frac{1}{10}\sqrt[3]{n}$. For example, the cube root of 731,000 may be found

by using the form, $\sqrt[3]{731.000} = 10\sqrt[3]{731}$. The tabular value of the root for 731 is 9.008223. The desired root is, therefore, 90.08223.

Powers of Numbers—This table is given to supplement the values of squares and cubes of numbers found in the preceding numerical table. The larger numbers are expressed exponentially to at least seven significant figures. The approximate value written as a whole number may be obtained by shifting the decimal point to the right by the number of places indicated in the exponent of 10 shown at the head of each group of values. For example: the approximate value of 33^8 is found in the table as 14.064086×10^{11}. Written as a whole number it is 1,406,408,600,000.

Factorials and their Logarithms—The product $n \times (n - 1) \times (n - 2) \times \cdots \times 1$ is called factorial n, expressed as $n!$ or $\underline{|n}$. For example: factorial $5 = 5 \times 4 \times 3 \times 2 \times 1 = 120$. Factorials are very often met with in series. For purposes of computation in such cases the table giving the values of the factorials and of their logarithms for numbers from 1 to 100 is provided. The values of the factorials are expressed exponentially to 5 significant figures.

A brief table of exact values and reciprocals of factorials is to be found on page 140.

Factors for Computing Probable Errors—The probable error of a series of n measures $a_1, a_2, a_3 \ldots a_n$, the mean of which is m, is given by the expression,

$$e = \frac{0.6745}{\sqrt{n-1}}\sqrt{(m - a_1)^2 + (m - a_2)^2 + \cdots (m - a_n)^2}$$

The probable error of the mean is,

$$E = \frac{0.6745}{\sqrt{n(n-1)}}\sqrt{(m - a_1)^2 + (m - a_2)^2 + \cdots (m - a_n)^2}$$

The following approximate equations are convenient forms for computation,

$$e = 0.8453\frac{\Sigma d}{\sqrt{n(n-1)}}$$

$$E = 0.8453\frac{\Sigma d}{n\sqrt{n-1}}$$

The symbol Σd represents the arithmetical sum of the deviations.

For convenience in computing the probable error the value of several of the factors involved is given for values of n from 2 to 100.

Probability of Occurrence of Deviations—The significance of deviations is indicated by this table. The probability of occurrence of deviations as great as or greater than any specific value is given for various ratios of deviation to probable error and also with respect to the standard deviation σ. The probability of occurrence is stated in per cent or chances in 100. The odds against occurrence are also stated. The probable error is $0.6745 \times (\sigma)$.

Areas, Ordinates and Derivatives of the Normal Curve of Error—If, for a large number of observations, the frequency y, of the occurrence of an error of magnitude t be plotted, a curve results whose equation may be written,

$$y = \frac{1}{\sqrt{2\pi}} e^{-t^2/2}$$

The area, ordinates and derivatives for this curve given in the table are useful in the treatment of observational data. A text on statistical methods should be consulted for a complete explanation.

Factors and Primes—The table presents the prime factors of *all* factorable numbers and the logarithms of all prime numbers from 1 to 2000.

Interest Tables—The equations involved in the computation and use of the interest tables are collected at the beginning of this section. For further explanation the reader is referred to a textbook of the mathematics of finance or investment. A much more complete set of interest tables is to be found in "Tables of Applied Mathematics in Finance, Insurance, Statistics," edited by James W. Glover.

LOGARITHMS OF THE TRIGONOMETRIC FUNCTIONS

Logarithms of the functions are given for each minute from 0-360°.

The quantity −10 is to be appended to all logarithms of the sine and cosine, to logarithms of the tangent from 0-45° and of the cotangent from 45-90°.

With degrees indicated at either side of the top of the page use the column headings at the top. With degrees stated at the bottom of the page use the column designations at the bottom.

With degrees at the left (top or bottom) use the minute column at the left, and with degrees on the right side of the page use the minute column at the right.

The method of determining the functions of small angles by the auxiliary quantities S and T is given in the section explaining the use of the mathematical tables at the front of the volume.

Min.	Values of S, −10 to be appended					Values of T, −10 to be appended					Sec.

NATURAL TRIGONOMETRIC FUNCTIONS

Values of the trigonometric functions of angles for each minute from 0–360°.

For degrees indicated at the top of the page use the column headings at the top. For degrees indicated at the bottom use the column indications at the bottom.

With degrees at the left of each block (top or bottom), use the minute column at the left and with degrees at the right of each block use the minute column at the right.

0° (180°) (359°) **179°**

* Values of the cosine, tangent and cotangent for angles in the table, 1.58 radians and above, are negative.

HAVERSINES

The following table gives the values of the haversines and their logarithms for angles from 0 to 180° at 10 minute intervals. Characteristics of the logarithms are omitted.

°	0′ Value	0′ Log	10′ Value	10′ Log	20′ Value	20′ Log	30′ Value	30′ Log	40′ Value	40′ Log	50′ Value	50′ Log
0	.0000	—	.0000	$\bar{6}$.3254	.0000	$\bar{6}$.9275	.0000	$\bar{5}$.2796	.0000	$\bar{5}$.5295	.0001	$\bar{5}$.7233

NATURAL OR NAPERIAN LOGARITHMS

To find the natural logarithm of a number which is 1/10 or 10 times a number whose logarithm is given, subtract from or add to the given logarithm the logarithm of 10.

A 0.00–0.99

-10 should be appended to each logarithm

DEGREES—RADIANS

1 radian = 57° 17′ 44″.80625

	log
1 radian = 57.29577 95131 degrees	1.75812 26324
1 radian = 3437.74677 07849 minutes	3.53627 38828
1 radian = 206264.80625 seconds	5.31442 51332
1 degree = 0.01745 32925 19943 radians	8.24187 73676–10
1 minute = 0.00029 08882 08666 radians	6.46372 61172–10
1 second = 0.00000 48481 36811 radians	4.68557 48668–10

DEGREES—RADIANS

The table gives in radians the angle which is expressed in degrees and minutes at the side and top. Angles expressed to the nearest minute and second can readily be converted to radians by adding to the equivalent of the whole number of degrees the equivalents of the minutes and seconds found on the third page of this table.

DEGREES AND DECIMAL FRACTIONS TO RADIANS

The table below facilitates conversion of an angle expressed in degrees and decimal fractions into radians. To convert 25.78 into radians, find the equivalents, successively, of 20°, 5°, 0°.7, 0°.08 and add.

Deg.	Radians	Deg.	Radians	Deg.	Radians	Deg.	Radians	Deg.	Radians
10	0.174533	1	0.017453	0.1	0.001745	0.01	0.000175	0.001	0.000017

Logarithmic Constants

$e = 2.71828\ 18285$ $M = \log_{10} e = 0.43429\ 44819$

$1/M = \log_e 10 = 2.30258\ 50930$ $\log_{10} M = \log_{10}\log_{10} e = 9.63778\ 43113$

$1/e = 0.36787\ 94412$

$\log_e 2 = 0.69314\ 71806$ $\log_{10} 2 = 0.30102\ 99957$

Change of Base

$$\log_a x = \log_b x / \log_b a$$

$$\log_{10} x = \log_e x / \log_e 10 \qquad \log_e x = \log_{10} x / \log_{10} e$$

$$\log_e x = 1/M \log_{10} x = 2.30258\ 50930 \log_{10} x$$

$$\log_{10} x = M \log_e x = 0.43429\ 44819 \log_e x$$

MISCELLANEOUS CONSTANTS

Mean radius of the earth, 3959 miles = 6371 kilometers.

1 degree of latitude at 40° = 69 miles.

1 nautical mile = 1′ of arc on the earth's surface at the equator.

Mean density of the earth, 5.522 grams per cm³.

Constant of gravitation, $K = 6.664 \times 10^{-8}$ = the attraction in dynes between two gram masses one centimeter apart.

Acceleration due to gravity at sea level, lat. 45° = 980.616 cm. per sec. per sec. = 32.172 feet per sec. per sec.

Length of seconds pendulum at sea level, lat. 45° = 99.356 cm. = 39.116 in.

Density of mercury at 0°C. = 13.59509 g. per cm³.

Density of water, maximum at 3.98° C. = 0.999973 g. per cm³.

Density of dry air at 0° C. and 760 mm. = .001293 g. per cm³.

Velocity of sound in dry air at 0° C., 33,136 cm. per sec. = 1089 feet per sec.

Velocity of light in a vacuum = 2.99796×10^{10} cm. per sec. = 983.571×10^{6} feet per sec. = 186,284 mi./sec.

Heat equivalent of fusion of water 79.24 cal. per gram.

Heat equivalent of vaporization of water, 535.9 cal. per gram.

Coefficient of expansion of gases, .003665.

Specific heat of air, at constant pressure, 0.238.

Electrochemical equivalent of silver, 0.001118 g. per sec. per int. ampere.

Mean wave length of sodium light, .00005893 cm. or 5893. ångström units.

Absolute wave length of red cadmium line in air, 760 mm. pressure, 15° C.; 6438.4696 ångström units.

GREEK ALPHABET

Κ κ	Kappa	k	Χ χ	Chi	ch
Λ λ	Lambda	l	Ψ ψ	Psi	ps
Μ μ	Mu	m	Ω ω	Omega	ō

NUMERICAL TABLES

Reciprocals, Circumference and Area of Circles

As a matter of convenience, the values of $1000 \times (1/n)$ are given in the table. To obtain the actual value of the reciprocal, shift the decimal point three places to the left.

Circumferences and areas of circles are given for the values of n as the diameter.

n	$1000\frac{1}{n}$	Circumference πn	Area $\frac{\pi n^2}{4}$	n	$1000\frac{1}{n}$	Circumference πn	Area $\frac{\pi n^2}{4}$

Squares, Cubes and Roots

Roots of numbers other than those given directly may be found by the following relations:

$\sqrt{100n} = 10\sqrt{n}$; $\sqrt{1000n} = 10\sqrt{10n}$; $\sqrt{\frac{1}{10}n} = \frac{1}{10}\sqrt{10n}$; $\sqrt{\frac{1}{100}n} = \frac{1}{10}\sqrt{n}$; $\sqrt{\frac{1}{1000}n} = \frac{1}{100}\sqrt{10n}$; $\sqrt[3]{1000n} = 10\sqrt[3]{n}$; $\sqrt[3]{10{,}000n} = 10\sqrt[3]{10n}$; $\sqrt[3]{100{,}000n} = 10\sqrt[3]{100n}$; $\sqrt[3]{\frac{1}{10}n} = \frac{1}{10}\sqrt[3]{100n}$; $\sqrt[3]{\frac{1}{100}n} = \frac{1}{10}\sqrt[3]{10n}$; $\sqrt[3]{\frac{1}{1000}n} = \frac{1}{10}\sqrt[3]{n}$.

PROBABILITY OF OCCURRENCE OF DEVIATIONS

Valid for thirty or more samples.

Probability of occurrence, expressed as per cent, and odds against a deviation as great or greater than that designated is given for various ratios of the deviation to the probable error and to the standard deviation.

(From Pearl, Medical Biometry and Statistics, W. B. Saunders Company, publishers, by permission.)

Ratio dev. to P.E.	Probable occurrence %	Odds against, to 1	Ratio dev. to std. dev.	Probable occurrence %	Odds against, to 1

AREAS, ORDINATES AND DERIVATIVES OF THE NORMAL CURVE OF ERROR

The following table gives values of the area under the curve from the ordinate at $t = 0$ to the ordinate for the values of t given in the column at the left. Values of the ordinate and of the second, third and fourth derivatives are also given.

t	Area	Ordinate	Second derivative	Third derivative	Fourth derivative	t	Area	Ordinate	Second derivative	Third derivative	Fourth derivative

FACTORS AND PRIMES

FACTORS AND PRIMES

If n is prime the mantissa of its logarithm is given.

n	0	1	2	3	4
0	....	**0000000**	**3010300**	**4771213**	2^2
1	$2 \cdot 5$	**0413927**	$2^2 \cdot 3$	**1139434**	$2 \cdot 7$

INTEREST TABLES

Simple Interest

If P is the principal placed at interest at a rate i (expressed as a decimal), for a period of n years

The amount,

$$A = P(1 + ni)$$

Present value,

$$P = \frac{A}{1 + ni}$$

Compound Interest

At interest compounded annually the **amount,**—

$$A = P(1 + i)^n$$

At interest compounded q times per year,—

$$A = P\left(1 + \frac{i}{q}\right)^{nq}$$

At interest compounded annually the **present value,**—

$$P = \frac{A}{(1 + i)^n} = A(1 + i)^{-n} = Av^n. \qquad v = \frac{1}{1 + i}$$

At interest compounded q times per year,—

$$P = A\left(1 + \frac{i}{q}\right)^{-nq}$$

The **amount of an annuity of 1 per annum,**—

$$s_{\overline{n}|} \text{ at } i = \frac{(1 + i)^n - 1}{i}$$

The **present value of an annuity,**—

$$a_{\overline{n}|} \text{ at } i = \frac{1 - (1 + i)^{-n}}{i}$$

The **annuity whose present value is 1,**—

$$\frac{1}{a_{\overline{n}|} \text{ at } i} = \frac{1}{s_{\overline{n}|}} + i = \frac{i}{(1 - v^n)}$$

Compound amount of 1 for fractional periods,—$(1 + i)^{1/p}$

Nominal rate convertible p times per year **equivalent** to effective rate i,—

$$j_p = p[(1 + i)^{1/p} - 1]$$

Amount for year of p deposits of $1/p$, p times **per year,**—i/j_p

THE NUMBER OF EACH DAY OF THE YEAR

Day of Mo.	Jan.	Feb.	Mar.	Apr.	May	Jun.	Jul.	Aug.	Sep.	Oct.	Nov.	Dec.	Day of Mo.

PRESENT VALUE $1/(1 + i)^n$

The following table gives the value of unit amount due in n years at rate of interest i, compounded annually, $1/(1 + i)^n = v^n$.

Years	Rate i				
n	.0025($\frac{1}{4}$ %)	.004167($\frac{5}{12}$ %)	.005($\frac{1}{2}$ %)	.005833($\frac{7}{12}$ %)	.0075($\frac{3}{4}$ %)

AMOUNT OF ANNUITY $[(1 + i)^n - 1]/i$

The following table gives the amount of an annuity of unit value per period after a term of n periods at rate of interest of i per period; usually indicated as ($s_{\overline{n|}}$ at i).

Years	Rate i				
n	.0025($\frac{1}{4}$ %)	.004167($\frac{5}{12}$ %)	.005($\frac{1}{2}$ %)	.005833($\frac{7}{12}$ %)	.0075($\frac{3}{4}$ %)

PRESENT VALUE OF ANNUITY $[1 - (1 + i)^{-n}]/i$

The following table gives the present value of an annuity of unit value per period for a term of n periods at rate of interest i per period; usually indicated as $a_{\overline{n|}}$ at i.

Years	Rate i				
n	.0025($\frac{1}{4}$ %)	.004167($\frac{5}{12}$ %)	.005($\frac{1}{2}$ %)	.005833($\frac{7}{12}$ %)	.0075($\frac{3}{4}$ %)

AMERICAN EXPERIENCE MORTALITY TABLE

Based on 100,000 living at age 10, giving: l_x, number of living; d_x, number of deaths; p_x, probability of living; q_x, probability of dying for age x from 10 to 95.

CALCULUS

Differentials

$d\,ax = a dx$

$d(u + v) = du + dv$

$d\,uv = udv + vdu$

$d\frac{u}{v} = \frac{vdu - udv}{v^2}$

$d\,x^n = n\,x^{n-1}dx$

$dx^y = yx^{y-1}dx + x^y \log_e x\,dy$

$d\,e^x = e^x\,dx$

$d\,e^{ax} = a\,e^{ax}dx$

$d\,a^x = a^x \log_e a\,dx$

$d \log_e x = x^{-1}dx$

$d \log_a x = x^{-1} \log_a e\,dx$

$d\,x^x = x^x\,(1 + \log_e x)\,dx$

$d \sin x = \cos x\,dx$

$d \cos x = -\sin x\,dx$

$d \tan x = \sec^2 x\,dx$

$d \cot x = -\csc^2 x\,dx$

$d \sec x = \tan x \sec x\,dx$

$d \csc x = -\cot x \cdot \csc x\,dx$

$d \operatorname{vers} x = \sin x\,dx$

$d \sin^{-1}x = (1 - x^2)^{-\frac{1}{2}}dx$

$d \cos^{-1}x = -(1 - x^2)^{-\frac{1}{2}}dx$

$d \tan^{-1}x = (1 + x^2)^{-1}dx$

$d \cot^{-1}x = -(1 + x^2)^{-1}dx$

$d \sec^{-1}x = x^{-1}(x^2 - 1)^{-\frac{1}{2}}dx$

$d \csc^{-1}x = -x^{-1}\,(x^2 - 1)^{-\frac{1}{2}}dx$

$d \operatorname{vers}^{-1} x = (2x - x^2)^{-\frac{1}{2}}\,dx$

$d \sinh x = \cosh x\,dx$

$d \cosh x = \sinh x\,dx$

$d \tanh x = \operatorname{sech}^2 x\,dx$

$d \coth x = -\operatorname{csch}^2 x\,dx$

$d \operatorname{sech} x = -\operatorname{sech} x \tanh x\,dx$

$d \operatorname{csch} x = -\operatorname{csch} x \coth x\,dx$

$d \sinh^{-1} x = (x^2 + 1)^{-\frac{1}{2}}dx$

$d \cosh^{-1} x = (x^2 - 1)^{-\frac{1}{2}}dx$

$d \tanh^{-1} x = (1 - x^2)^{-1}dx$

$d \coth^{-1} x = -(x^2 - 1)^{-1}dx$

$d \operatorname{sech}^{-1} x = -x(1 - x^2)^{-\frac{1}{2}}dx$

$d \operatorname{csch}^{-1} x = -x(x^2 + 1)^{-\frac{1}{2}}dx$

INTEGRALS

Elementary Forms

1. $\int a\,dx = ax.$

2. $\int a \cdot f(x)dx = a \int f(x)dx.$

3. $\int \phi(y)dx = \int \frac{\phi(y)}{y'}\,dy,$ where $y' = dy/dx.$

4. $\int (u + v)\,dx = \int u\,dx + \int v\,dx$, where u and v are any functions of x.

5. $\int u\,dv = uv - \int v\,du.$

6. $\int u \frac{dv}{dx}\,dx = uv - \int v \frac{du}{dx}\,dx.$

7. $\int x^n\,dx = \frac{x^{n+1}}{n+1},$ except $n = -1.$

8. $\int \frac{f'(x)\,dx}{f(x)} = \log f(x),$ $[d\,f(x) = f'(x)\,dx].$

9. $\int \frac{dx}{x} = \log x, \text{ or } \log(-x).$

10. $\int \frac{f'(x)\,dx}{2\sqrt{f(x)}} = \sqrt{f(x)}.$ $[d\,f(x) = f'(x)\,dx].$

11. $\int e^x\,dx = e^x.$

12. $\int e^{ax}\,dx = e^{ax}/a.$

13. $\int b^{ax}\,dx = \frac{b^{ax}}{a \log b}.$

14. $\int \log x\,dx = x \log x - x.$

15. $\int a^x \log a\,dx = a^x.$

16. $\int \frac{dx}{a^2 + x^2} = \frac{1}{a}\tan^{-1}\left(\frac{x}{a}\right), \text{ or } -\frac{1}{a}\cot^{-1}\left(\frac{x}{a}\right).$

17. $\int \frac{dx}{a^2 - x^2} = \frac{1}{a}\tanh^{-1}\left(\frac{x}{a}\right), \text{ or } \frac{1}{2a}\log\frac{a+x}{a-x}.$

18. $\int \frac{dx}{x^2 - a^2} = -\frac{1}{a}\coth^{-1}\left(\frac{x}{a}\right), \text{ or } \frac{1}{2a}\log\frac{x-a}{x+a}.$

19. $\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1}\left(\frac{x}{a}\right), \text{ or } -\cos^{-1}\left(\frac{x}{a}\right).$

20. $\int \frac{dx}{\sqrt{x^2 \pm a^2}} = \log\left(x + \sqrt{x^2 \pm a^2}\right).$

21. $\int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{a}\cos^{-1}\left(\frac{a}{x}\right).$

22. $\int \frac{dx}{x\sqrt{a^2 \pm x^2}} = -\frac{1}{a}\log\left(\frac{a + \sqrt{a^2 \pm x^2}}{x}\right).$

23. $$\int \frac{dx}{x\sqrt{a+bx}} = \frac{2}{\sqrt{-a}} \tan^{-1} \sqrt{\frac{a+bx}{-a}}, \text{ or } \frac{-2}{\sqrt{a}} \tanh^{-1} \sqrt{\frac{a+bx}{a}}.$$

Forms Containing $(a + bx)$

24. $$\int (a+bx)^n dx = \frac{(a+bx)^{n+1}}{(n+1)b}, \text{ except } n = -1.$$

25. $$\int x\,(a+bx)^n dx = \frac{1}{b^2(n+2)}(a+bx)^{n+2} - \frac{a}{b^2(n+1)}(a+bx)^{n+1}, \text{ except } n = -1 \text{ or } -2.$$

26. $$\int x^2 (a+bx)^n\, dx = \frac{1}{b^3}\left[\frac{(a+bx)^{n+3}}{n+3} - 2a\,\frac{(a+bx)^{n+2}}{n+2} + a^2\,\frac{(a+bx)^{n+1}}{n+1}\right].$$

27. $$\int x^m (a+bx)^n\, dx = \frac{x^{m+1}(a+bx)^n}{m+n+1} + \frac{an}{m+n+1}\int x^m (a+bx)^{n-1}\, dx.$$

299. $\int x \, e^{ax} \, dx = \frac{e^{ax}}{a^2} (ax - 1).$

300. $\int x^m e^{ax} \, dx = \frac{x^m e^{ax}}{a} - \frac{m}{a} \int x^{m-1} e^{ax} \, dx.$

301. $\int \frac{e^{ax} \, dx}{x} = \log x + \frac{ax}{1!} + \frac{a^2 x^2}{2 \cdot 2!} + \frac{a^3 x^3}{3 \cdot 3!} + \cdots$

302. $\int \frac{e^{ax}}{x^m} \, dx = -\frac{1}{m-1} \frac{e^{ax}}{x^{m-1}} + \frac{a}{m-1} \int \frac{e^{ax}}{x^{m-1}} \, dx.$

303. $\int e^{ax} \log x \, dx = \frac{e^{ax} \log x}{a} - \frac{1}{a} \int \frac{e^{ax}}{x} \, dx.$

304. $\int e^{ax} \cdot \sin px \, dx = \frac{e^{ax} (a \sin px - p \cos px)}{a^2 + p^2}.$

305. $\int e^{ax} \cdot \cos px \, dx = \frac{e^{ax} (a \cos px + p \sin px)}{a^2 + p^2}.$

306. $\int \frac{dx}{1 + e^x} = x - \log (1 + e^x) = \log \frac{e^x}{1 + e^x}.$

307. $\int \frac{dx}{a + be^{px}} = \frac{x}{a} - \frac{1}{ap} \log (a + be^{px}).$

308. $\int \frac{dx}{ae^{mx} + be^{-mx}} = \frac{1}{m\sqrt{ab}} \tan^{-1} \left(e^{mx}\sqrt{\frac{a}{b}}\right).$

309. $\int e^{ax} \sin px \, dx = \frac{e^{ax} (a \sin px - p \cos px)}{a^2 + p^2}.$

310. $\int e^{ax} \cos px \, dx = \frac{e^{ax} (a \cos px + p \sin px)}{a^2 + p^2}.$

311. $\int e^{ax} \sin^n bx \, dx = \frac{1}{a^2 + n^2b^2}\Big((a \sin bx - nb \cos bx)$

$e^{ax} \sin^{n-1} bx + n (n - 1)b^2 \int e^{ax} \sin^{n-2} bx \cdot dx\Big).$

312. $\int e^{ax} \cos^n bx \, dx = \frac{1}{a^2 + n^2b^2}\Big((a \cos bx + nb \sin bx)$

$e^{ax} \cos^{n-1} bx + n (n - 1)b^2 \int e^{ax} \cos^{n-2} bx \, dx\Big).$

---

313. $\int \sinh x \, dx = \cosh x.$
314. $\int \cosh x \, dx = \sinh x.$
315. $\int \tanh x \, dx = \log \cosh x.$
316. $\int \coth x \, dx = \log \sinh x.$
317. $\int \operatorname{sech} x \, dx = 2 \tan^{-1} (e^x).$

318. $\int \operatorname{csch} x \, dx = \log \tanh \left(\frac{x}{2}\right).$

319. $\int x \sinh x \, dx = x \cosh x - \sinh x.$
320. $\int x \cosh x \, dx = x \sinh x - \cosh x.$
321. $\int \operatorname{sech} x \tanh x \, dx = - \operatorname{sech} x.$
322. $\int \operatorname{csch} x \coth x \, dx = - \operatorname{csch} x.$

DEFINITE INTEGRALS

323. $\int_0^\infty x^{n-1} e^{-x} \, dx = \int_0^1 \left(\log \frac{1}{x}\right)^{n-1} dx = \Gamma (n).$

324. $\Gamma (n)$, the gamma function is finite if $n > 0$.

325. $\Gamma (n + 1) = n\Gamma (n).$

326. $\Gamma(n) \cdot \Gamma(1-n) = \dfrac{\pi}{\sin n\pi}$.

327. $\Gamma(n) = (n-1)!$ if $n =$ integer > 0.

328. $\Gamma(\frac{1}{2}) = \sqrt{\pi}$.

(See values of $\Gamma(n)$ at end of integral table.)

329. $$\int_0^1 x^{m-1}(1-x)^{n-1}\,dx = \int_0^\infty \frac{x^{m-1}\,dx}{(1+x)^{m+n}} = \frac{\Gamma(m)\,\Gamma(n)}{\Gamma(m+n)}.$$

330. $$\int_1^\infty \frac{dx}{x^m} = \frac{1}{m-1}, \qquad [m > 1].$$

331. $$\int_0^\infty \frac{dx}{(1+x)x^p} = \pi \csc p\pi, \qquad [p < 1].$$

332. $$\int_0^\infty \frac{dx}{(1-x)x^p} = -\pi \cot p\pi, \qquad [p < 1].$$

333. $$\int_0^\infty \frac{x^{p-1}\,dx}{1+x} = \frac{\pi}{\sin p\pi}, \qquad [0 < p < 1].$$

334. $$\int_0^\infty \frac{x^{m-1}\,dx}{1+x^n} = \frac{\pi}{n \sin \dfrac{m\pi}{n}}, \qquad [0 < m < n].$$

335. $$\int_0^\infty \frac{dx}{(1+x)\sqrt{x}} = \pi.$$

336. $$\int_0^\infty \frac{a\,dx}{a^2+x^2} = \frac{\pi}{2}, \text{ if } a > 0;\ 0, \text{ if } a = 0;\ -\frac{\pi}{2}, \text{ if } a < 0.$$

337. $$\int_0^{\pi/2} \sin^n x\,dx = \int_0^{\pi/2} \cos^n x\,dx$$
$$= \frac{1 \cdot 3 \cdot 5 \cdots (n-1)}{2 \cdot 4 \cdot 6 \cdots (n)} \cdot \frac{\pi}{2}, \qquad [n \text{ an even integer}],$$
$$= \frac{2 \cdot 4 \cdot 6 \cdots (n-1)}{1 \cdot 3 \cdot 5 \cdot 7 \cdots n}, \qquad [n \text{ an odd integer}],$$
$$= \frac{1}{2}\sqrt{\pi}\,\frac{\Gamma\left(\dfrac{n+1}{2}\right)}{\Gamma\left(\dfrac{n}{2}+1\right)}, \qquad [n > -1].$$

338. $$\int_0^\infty \frac{\sin mx\,dx}{x} = \frac{\pi}{2}, \text{ if } m > 0;\ 0, \text{ if } m = 0;\ -\frac{\pi}{2}, \text{ if } m < 0.$$

339. $$\int_0^\infty \frac{\cos x\,dx}{x} = \infty.$$

340. $$\int_0^\infty \frac{\tan x\,dx}{x} = \frac{\pi}{2}.$$

341. $\int_0^\pi \sin kx \cdot \sin mx\, dx = \int_0^\pi \cos kx \cdot \cos mx\, dx = 0,$

$[k \neq m;\ m,\ n = \text{integers}].$

342. $\int_0^\infty \frac{\sin x \cos mx\, dx}{x} = 0,\ m < -1 \text{ or } m > 1,$

$= \frac{\pi}{4},\ \text{if } m = \pm 1;\ = \frac{\pi}{2},\ \text{if } m^2 < 1.$

343. $\int_0^\pi \sin^2 mx\, dx = \int_0^\pi \cos^2 mx\, dx = \frac{\pi}{2}.$

344. $\int_0^\infty \frac{\sin^2 x\, dx}{x^2} = \frac{\pi}{2}.$

345. $\int_0^\infty \frac{\cos mx}{1 + x^2}\, dx = \frac{\pi}{2} e^{-m},$ $[m > 0],$

$= \frac{\pi}{2} e^{m},$ $[m < 0].$

346. $\int_0^\infty \cos (x^2)\, dx = \int_0^\infty \sin (x^2)\, dx = \frac{1}{2}\sqrt{\frac{\pi}{2}}.$

347. $\int_0^\infty \frac{\sin x\, dx}{\sqrt{x}} = \int_0^\infty \frac{\cos x\, dx}{\sqrt{x}} = \sqrt{\frac{\pi}{2}}.$

348. $\int_0^{\pi/2} \frac{dx}{1 + a \cos x} = \frac{\cos^{-1} a}{\sqrt{1 - a^2}},$ $[a < 1].$

ALGEBRA

Factors and Expansions

$$(a \pm b)^2 = a^2 \pm 2ab + b^2.$$
$$(a \pm b)^3 = a^3 \pm 3a^2b + 3ab^2 \pm b^3.$$
$$(a \pm b)^4 = a^4 \pm 4a^3b + 6a^2b^2 \pm 4ab^3 + b^4.$$
$$a^2 - b^2 = (a - b)(a + b).$$
$$a^2 + b^2 = \left(a + b\sqrt{-1}\right)\left(a - b\sqrt{-1}\right).$$
$$a^3 - b^3 = (a - b)(a^2 + ab + b^2).$$
$$a^3 + b^3 = (a + b)(a^2 - ab + b^2).$$
$$a^4 + b^4 = \left(a^2 + ab\sqrt{2} + b^2\right)\left(a^2 - ab\sqrt{2} + b^2\right).$$
$$a^n - b^n = (a - b)(a^{n-1} + a^{n-2}b + \ldots. + b^{n-1}).$$
$$a^n - b^n = (a + b)(a^{n-1} - a^{n-2}b + \ldots. - b^{n-1}),$$
for even values of n.
$$a^n + b^n = (a + b)\ (a^{n-1} - a^{n-2}b + \ldots. + b^{n-1}),$$
for odd values of n.
$$a^4 + a^2b^2 + b^4 = (a^2 + ab + b^2)(a^2 - ab + b^2).$$
$$(a + b + c)^2 = a^2 + b^2 + c^2 + 2ab + 2ac + 2bc.$$
$$(a + b + c)^3 = a^3 + b^3 + c^3 + 3a^2(b + c) + 3b^2(a + c) + 3c^2(a + b) + 6abc.$$
$$(a + b + c + d + \ldots)^2 = a^2 + b^2 + c^2 + d^2 + \ldots + 2a(b + c + d + \ldots) + 2b(c + d + \ldots) + 2c(d + \ldots) + \ldots$$

See also under Series

Powers and Roots

$$a^x \times a^y = a^{(x+y)}. \qquad a^0 = 1 \text{ [if } a \neq 0]. \qquad (ab)^x = a^x b^x.$$

$$\frac{a^x}{a^y} = a^{(x-y)}. \qquad a^{-x} = \frac{1}{a^x}. \qquad \left(\frac{a}{b}\right)^x = \frac{a^x}{b^x}.$$

$$(a^x)^y = a^{xy}. \qquad a^{\frac{1}{x}} = \sqrt[x]{a}. \qquad \sqrt[x]{ab} = \sqrt[x]{a}\,\sqrt[x]{b}.$$

$$\sqrt[x]{\sqrt[y]{a}} = \sqrt[xy]{a}. \qquad a^{\frac{x}{y}} = \sqrt[y]{a^x}. \qquad \sqrt[x]{\frac{a}{b}} = \frac{\sqrt[x]{a}}{\sqrt[x]{b}}.$$

Proportion

If $\dfrac{a}{b} = \dfrac{c}{d}$, then $\dfrac{a + b}{b} = \dfrac{c + d}{d}$,

$$\frac{a - b}{b} = \frac{c - d}{d}, \qquad \frac{a - b}{a + b} = \frac{c - d}{c + d}.$$

ALGEBRA—(Continued)

SUMS OF NUMBERS

The sum of the first n numbers,—

$$\Sigma(n) = 1+2+3+4+5\ \ldots\ +n = \frac{n(n+1)}{2}$$

The sum of the squares of the first n numbers,

$$\Sigma(n^2) = 1^2+2^2+3^2+4^2+5^2\ \ldots\ +n^2 = \frac{n(n+1)(2n+1)}{6}$$

The sum of the cubes of the first n numbers,

$$\Sigma(n^3) = 1^3+2^3+3^3+4^3+5^3\ \ldots\ +n^3 = \frac{n^2(n+1)^2}{4}$$

ARITHMETICAL PROGRESSION

If a is the first term; l, the last term; d, the common difference; n, the number of terms and s, the sum of n terms,—

$$l = a + (n-1)d \qquad s = \frac{n}{2}(a+l)$$

$$s = \frac{n}{2}\left\{2a+(n-1)d\right\}$$

GEOMETRICAL PROGRESSION

If a is the first term; l, the last term; r, the common ratio; n, the number of terms and s, the sum of n terms,—

$$l = ar^{n-1} \qquad s = a\frac{(1-r^n)}{1-r}$$

$$s = a\frac{(r^n-1)}{r-1} \qquad s = \frac{lr-a}{r-1}$$

If n is infinity and r^2 less than unity,—

$$s = \frac{a}{1-r}$$

FACTORIALS

$$\lfloor n = n! = e^{-n}n^n\sqrt{2\pi n}, \text{ approximately.}$$

PERMUTATIONS

If M denote the number of permutations of n things taken p at a time,—

$$M = n(n-1)(n-2)\ \ldots\ (n-p+1)$$

COMBINATIONS

If M denote the number of combinations of n things taken p at a time,—

$$M = \frac{n(n-1)(n-2)\ \ldots\ (n-p+1)}{p!}$$

$$M = \frac{n!}{p!(n-p)!}$$

ALGEBRA (Continued)

Quadratic Equations

Any quadratic equation may be reduced to the form, —

$$ax^2 + bx + c = 0$$

Then $x = \dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

If $b^2 - 4ac$ is positive the roots are real and unequal.
If $b^2 - 4ac$ is zero the roots are real and equal.
If $b^2 - 4ac$ is negative the roots are imaginary and unequal.
If $b^2 - 4ac$ is a perfect square the roots are rational and unequal.

Cubic Equations

A cubic equation, $y^3 + py^2 + qy + r = 0$ may be reduced to the form, —

$$x^3 + ax + b = 0$$

by substituting for y the value, $\left(x - \frac{p}{3}\right)$. Here

$$a = \tfrac{1}{3}(3q - p^2) \text{ and } b = \tfrac{1}{27}(2p^3 - 9pq + 27r).$$

For solution let, —

$$A = \sqrt[3]{-\frac{b}{2} + \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}}, \qquad B = \sqrt[3]{-\frac{b}{2} - \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}},$$

then the values of x will be given by,

$$x = A + B, \quad -\frac{A+B}{2} + \frac{A-B}{2}\sqrt{-3}, \quad -\frac{A+B}{2} - \frac{A-B}{2}\sqrt{-3}$$

If $\dfrac{b^2}{4} + \dfrac{a^3}{27} > 0$, there will be one real root and two conjugate imaginary roots.

If $\dfrac{b^2}{4} + \dfrac{a^3}{27} = 0$, there will be three real roots of which two at least are equal

If $\dfrac{b^2}{4} + \dfrac{a^3}{27} < 0$, there will be three real and unequal roots.

In the last case a trigonometric solution is useful. Compute the value of the angle ϕ in the expression, —

$$\cos\phi = \sqrt{\frac{b^2}{4} \div \left(-\frac{a^3}{27}\right)},$$

then x will have the following values:—

$$\mp 2\sqrt{-\frac{a}{3}}\cos\frac{\phi}{3}, \qquad \mp 2\sqrt{-\frac{a}{3}}\cos\left(\frac{\phi}{3} + 120°\right),$$

$$\mp 2\sqrt{-\frac{a}{3}}\cos\left(\frac{\phi}{3} + 240°\right).$$

APPROXIMATIONS

If a and b are small quantities, the following relations are approximately true,—

$$(1 \pm a)^m = 1 \pm ma,$$

$$(1 \pm a)^m (1 \pm b)^n = 1 \pm ma \pm nb.$$

If n is nearly equal to m,

$$\sqrt{mn} = \frac{n+m}{2}, \text{ approximately.}$$

If θ is a very small angle expressed in radians,—

$$\frac{\sin\theta}{\theta} = 1 \text{ and } \frac{\tan\theta}{\theta} = 1, \text{ approximately.}$$

SERIES

The expression in parentheses following certain of the series indicates the region of convergence. If not otherwise indicated it is to be understood that the series converges for all finite values of x.

Binomial

$$(x+y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{2!}x^{n-2}y^2 + \frac{n(n-1)(n-2)}{3!}x^{(n-3)}y^3 + \ldots \quad (y^2 < x^2)$$

$$(1 \pm x)^n = 1 \pm nx + \frac{n(n-1)x^2}{2!} \pm \frac{n(n-1)(n-2)x^3}{3!} + \ldots \text{ etc.} \quad (x^2 < 1)$$

$$(1 \pm x)^{-n} = 1 \mp nx + \frac{n(n+1)x^2}{2!} \mp \frac{n(n+1)(n+2)x^3}{3!} + \ldots \text{ etc.} \quad (x^2 < 1)$$

$$(1 \pm x)^{-1} = 1 \mp x + x^2 \mp x^3 + x^4 \mp x^5 + \ldots \quad (x^2 < 1)$$

$$(1 \pm x)^{-2} = 1 \mp 2x + 3x^2 \mp 4x^3 + 5x^4 \mp 6x^5 + \ldots \quad (x^2 < 1)$$

Taylor's Series

$$f(x+h) = f(x) + hf'(x) + \frac{h^2}{2!}f''(x) + \frac{h^3}{3!}f'''(x) + \ldots$$

$$= f(h) + xf'(h) + \frac{x^2}{2!}f''(h) + \frac{x^3}{3!}f'''(h) + \ldots$$

Maclaurin's Series

$$f(x) = f(o) + xf'(o) + \frac{x^2}{2!}f''(o) + \frac{x^3}{3!}f'''(o) + \ldots$$

Exponential

$$e = 1 + \frac{1}{1} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \ldots$$

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \ldots$$

$$a^x = 1 + x\log a + \frac{(x\log a)^2}{2!} + \frac{(x\log a)^3}{3!} + \ldots$$

Logarithmic

$$\log_e x = \frac{x-1}{x} + \frac{1}{2}\left(\frac{x-1}{x}\right)^2 + \frac{1}{3}\left(\frac{x-1}{x}\right)^3 + \ldots \qquad (x > \tfrac{1}{2})$$

$$\log_e x = (x-1) - \tfrac{1}{2}(x-1)^2 + \tfrac{1}{3}(x-1)^3 - \ldots \qquad (2 > x > 0)$$

$$\log_e x = 2\left[\frac{x-1}{x+1} + \frac{1}{3}\left(\frac{x-1}{x+1}\right)^3 + \frac{1}{5}\left(\frac{x-1}{x+1}\right)^5 + \ldots\right] \qquad (x > 0)$$

$$\log_e(1+x) = x - \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 - \tfrac{1}{4}x^4 + \ldots \qquad (-1 < x < 1)$$

$$\log_e(n+1) - \log_e(n-1) = 2\left[\frac{1}{n} + \frac{1}{3n^3} + \frac{1}{5n^5} + \ldots\right]$$

$$\log_e(a+x) = \log_e a + 2\left[\frac{x}{2a+x} + \frac{1}{3}\left(\frac{x}{2a+x}\right)^3 + \frac{1}{5}\left(\frac{x}{2a+x}\right)^5 + \ldots\right] \qquad (a > 0,\ -a < x < +\infty)$$

Trigonometric

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \ldots$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \ldots$$

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

$$\sin^{-1} x = x + \frac{x^3}{6} + \frac{1}{2}\cdot\frac{3}{4}\cdot\frac{x^5}{5} + \frac{1}{2}\cdot\frac{3}{4}\cdot\frac{5}{6}\cdot\frac{x^7}{7} + \ldots \qquad (x^2 < 1)$$

$$\tan^{-1} x = x - \tfrac{1}{3}x^3 + \tfrac{1}{5}x^5 - \tfrac{1}{7}x^7 + \ldots \qquad (x^2 < 1)$$

$$= \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \ldots \qquad (x^2 > 1)$$

$$\log_e \sin x = \log_e x - \frac{x^2}{6} - \frac{x^4}{180} - \frac{x^6}{2835} - \ldots \qquad (x^2 < \pi^2)$$

$$\log_e \cos x = -\frac{x^2}{2} - \frac{x^4}{12} - \frac{x^6}{45} - \frac{17x^8}{2520} - \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

$$\log_e \tan x = \log_e x + \frac{x^2}{3} + \frac{7x^4}{90} + \frac{62x^6}{2835} + \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

$$e^{\sin x} = 1 + x + \frac{x^2}{2!} - \frac{3x^4}{4!} - \frac{8x^5}{5!} - \frac{3x^6}{6!} + \ldots$$

$$e^{\cos x} = e\left(1 - \frac{x^2}{2!} + \frac{4x^4}{4!} - \frac{31x^6}{6!} + \ldots\right)$$

$$e^{\tan x} = 1 + x + \frac{x^2}{2!} + \frac{3x^3}{3!} + \frac{9x^4}{4!} + \frac{37x^5}{5!} + \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

ALGEBRA (Continued)

MISCELLANEOUS

The Sum (Σ, = Sigma) and Product (Π, = Pi) Notations

Σ denotes the **sum**, and Π, the **product** of all quantities of a given collection. In particular,

$$\sum_{i=m}^{m+n} x_i \text{ means } x_m + x_{m+1} + \ldots + x_{m+n}, \ (n + 1 \text{ terms in all}),$$

$$\prod_{i=m}^{m+n} x_i \text{ means } x_m x_{m+1} \ldots x_{m+n}, \ (n + 1 \text{ factors in all}).$$

For indicated **range**, R, (such as $m \leqq i \leqq m + n$), one may write $\sum_R x_i$, $\prod_R x_i$, respectively. Where the range is clear from the context one writes Σx_i, Πx_i, or even Σx, Πx, respectively. For c a constant and for x_i and y_i with common range (say of n elements),

$$\Sigma c x_i = c \Sigma x_i, \ \Sigma(x_i + y_i) = \Sigma x_i + \Sigma y_i, \ \Sigma(x_i + c) = nc + \Sigma x_i.$$

Special Numerical Relations

(i) For range, $i = 1, 2, \ldots, n$, with $x_i = i$.
$\Sigma x_i = n(n + 1)/2$, $\Sigma(2x_i - 1) = n^2$,
$\Sigma x_i^2 = n(n + 1)(2n + 1)/6$.
$\Sigma x_i^3 = (\Sigma x_i)^2$, $\Sigma x_i^4 = (\Sigma x_i^2)[6(\Sigma x_i) - 1]/5$.
$\Pi(c + 1 - x_i) = c^{(n)}$, $\Pi x_i = n^{(n)} = n!$ ("**factorial** n").
Hence $n! = n \cdot (n - 1)!$ $0!$ is defined to be 1.
Stirling's formula (used for n large),

$$\sqrt{2n\pi}(n/e)^n < n! < \sqrt{2n\pi}(n/e)^n\left(1 + \frac{1}{12n - 1}\right),$$
$$(\pi = 3.14159\ldots, e = 2.71828\ldots).$$

$n!/m!$ gives the number of **permutations of** n **distinct things taken** m **at a time.**

(ii) For range, $i = -\left(\frac{n-1}{2}\right), -\left(\frac{n-1}{2}\right) + 1, \ldots, \left(\frac{n-1}{2}\right) - 1, \left(\frac{n-1}{2}\right)$, with $x_i = i$ (whether n is odd or even),

$$\sum x_i = \sum x_i^3 = 0, \sum x_i^2 = \frac{n(n^2 - 1)}{12}, \sum x_i^4 = \frac{3n^2 - 7}{20}\sum x_i^2.$$

ALGEBRA (Continued)

(iii) The Binomial Coefficients, $\binom{n}{m}$.
$\binom{n}{m} = n!/[(n-m)!m!]$, for integers m, n, $0 \leqq m \leqq n$. $\binom{n}{0} = \binom{n}{n} = 1$.

$(x+c)^n = \sum_r \binom{n}{r} x^{n-r} c^r$, $(0 \leqq r \leqq n)$. The **binomial expansion** $\binom{n}{m}$ gives also the number of **combinations of n distinct things taken m at a time.**

$\binom{n}{m} + \binom{n}{m+1} = \binom{n+1}{m+1}$, **recursion relation** for binomial coefficients.

$$\binom{n}{n-m} = \binom{n}{m}, \quad \sum_r (-1)^r \binom{n}{r} = 0, \quad \sum_r \binom{n}{r}^2 = \binom{2n}{n}, \quad \sum_{s=m}^{n} \binom{s}{m} = \binom{n+1}{m+1}.$$

Table of Binomial Coefficients

n	$\binom{n}{0}$	$\binom{n}{1}$	$\binom{n}{2}$	$\binom{n}{3}$	$\binom{n}{4}$	$\binom{n}{5}$	$\binom{n}{6}$	$\binom{n}{7}$	$\binom{n}{8}$	$\binom{n}{9}$	$\binom{n}{10}$
0	1										
1	1	1									
2	1	2	1								
3	1	3	3	1							
4	1	4	6	4	1						
5	1	5	10	10	5	1					
6	1	6	15	20	15	6	1				
7	1	7	21	35	35	21	7	1			
8	1	8	28	56	70	56	28	8	1		
9	1	9	36	84	126	126	84	36	9	1	
10	1	10	45	120	210	252	210	120	45	10	1
11	1	11	55	165	330	462	462	330	165	55	11
12	1	12	66	220	495	792	924	792	495	220	66
13	1	13	78	286	715	1287	1716	1716	1287	715	286
14	1	14	91	364	1001	2002	3003	3432	3003	2002	1001
15	1	15	105	455	1365	3003	5005	6435	6435	5005	3003
16	1	16	120	560	1820	4368	8008	11440	12870	11440	8008
17	1	17	136	680	2380	6188	12376	19448	24310	24310	19448
18	1	18	153	816	3060	8568	18564	31824	43758	48620	43758
19	1	19	171	969	3876	11628	27132	50388	75582	92378	92378
20	1	20	190	1140	4845	15504	38760	77520	125970	167960	184756

NOTE: $\binom{n}{m} = \dfrac{n(n-1)(n-2)\ldots(n-m+1)}{m(m-1)(m-2)\ldots 3.2.1}$; $\binom{n}{0} = 1$; $\binom{n}{1} = n$.

For coefficients missing from the above table, use the relation

$\binom{n}{m} = \binom{n}{n-m}$, e.g. $\binom{20}{11} = \binom{20}{9} = 167960$.

ALGEBRA (Continued)

Finite Differences

For equi-spaced arguments x_i, and associated y_i, the successive **advancing** y**-differences** are, $\Delta^0 y_i = y_i$, $\Delta y_i = y_{i+1} - y_i$, $\Delta^2 y_i = \Delta y_{i+1} - \Delta y_i = y_{i+2} - 2y_{i+1} + y_i, \ldots,$ $\Delta^m y_i = \Delta^{m-1} y_{i+1} - \Delta^{m-1} y_i = \sum_r (-1)^r \binom{m}{r} y_{i+m-r}$. With arbitrary origin A and class-interval length, $x_{i+1} - x_i = h$, using $u_i = (x_i - A)/h$, write $y(u_i)$ for y_i. Then if for some fixed m, for the portion of the table considered, the values of $\Delta^{m+1} y_i$ be zero (or approximately, if these be regarded as negligible) **Newton's formula** gives

$$y(u) = \sum \frac{u^{(r)}}{r!} \Delta^r y(0) = y(0) + u\Delta y(0) + \frac{u(u-1)}{1 \cdot 2} \Delta^2 y(0) + \cdots + \frac{u(u-1)\ldots(u-m+1)}{m!} \Delta^m y(0).$$

This formula reduces to an identity for $u = u_0, u_1, \ldots, u_n$, $(u_i = i)$, and may be used to interpolate for intermediate values.

Example. Given

x	-4,	-2,	0,	2,	4,	6,	8,	. . .
y	10,	14,	30,	64,	122,	210,	334,	. . .

to find a value for y when $x = 10$, and when $x = 1$. Suppose for some reason A has been taken at $x = 2$. The work may be arranged as follows:

u	x	y	Δ	Δ^2	Δ^3	Δ^4
-3	-4	10				
			4			
-2	-2	14		12		
			16		6	
-1	0	30		18		0
			34		6	
0	2	64		24		0
			58		6	
1	4	122		30		0
			88		6	
2	6	210		36		—
			124		—	
3	8	334		—		—
			—		—	
—	—	—		—		—

$$y(u) = 64 + 58u + 30\frac{u(u-1)}{1 \cdot 2} + 6\frac{u(u-1)(u-2)}{1 \cdot 2 \cdot 3}$$
$$= 64 + 58u + 15u(u-1) + u(u-1)(u-2).$$

At $x = 10$, $u = 4$. Substituting $u = 4$, one has $y|_{x=10} = 500$.
At $x = 1$, $u = -\frac{1}{2}$. Substituting $u = -\frac{1}{2}$, one has $y|_{x=1} = 44\frac{3}{8}$.

STATISTICS

Central Measures

Here the range of i is from 1 to n. With each value x_i is associated a weighting factor $f_i \geq 0$ (such as the frequency, the probability, the mass, the reliability, or other multiplier).

N, the **total weight,** $= \Sigma f_i$.

$\bar{x}$, the **arithmetic mean,** $= \Sigma f_i x_i / N = \Sigma f_i x_i / \Sigma f_i$.

GM, the **geometric mean** (available when each x_i is positive), $= \sqrt[N]{\Pi x_i^{f_i}}$. $\text{Log } GM = \Sigma f_i \log x_i / N$.

Mo, the **mode,** = value among $(x_1, \ldots, x_n)$ having maximum associated f_i (usually obtained by interpolating after the data are graduated). For unweighted items, x_i, a mode is a value about which the values of x_i cluster most densely.

RMS, the **root-mean-square,** $= \sqrt{\Sigma f_i x_i^2 / N}$.

Md, the **median** (see below). For unweighted items, the median is the value, equaled or exceeded by exactly half of the values x_i in the given list. In case of a central pair, the median is usually taken as the arithmetic mean of this pair.

Mm, the **mid-mean** (see below). For unweighted items, the mid-mean is the arithmetic mean of the half-list obtained upon dropping out the highest quarter and lowest quarter of the items.

Cum $f|_X$, the value of "cumulative f" at X, $= \sum_{x_i < X} f_i$ (interpolation being used for X if necessary).

The M-Tiles

For **ungrouped data,** X is called the rth **m-tile** (or rth **m-tile mark**) ($r = 0, 1, \ldots, m$) if simultaneously, $\sum_{x_i < X} f_i/N \leq r/m$, and $\sum_{x_i > X} f_i/N \leq (m - r)/m$. In particular the zeroth m-tile is **min,** the minimal value among the list $(x_1, \ldots, x_n)$, and the mth m-tile is **max,** the maximal value among the list.

For **grouped data,** the rth m-tile mark, X, is such that

$$\text{Cum } f|_X = Nr/m, \quad (r = 0, 1, 2, \ldots, m).$$

$$\text{Cum } f|_{\min} = 0, \qquad \text{Cum } f|_{\max} = N.$$

In particular, certain intermediate $(0 < r < m)$ m-tile marks are named as follows:

m	$r = 1$	2	3	. . .
2	Md (median)			
3	T_1 (lower tertile)	T_2 (upper tertile)		
4	Q_1 (lower quartile)	Md	Q_3 (upper quartile)	
10	D_1 (first decile)	D_2	D_3	etc.
100	PC_1 (first percentile)	PC_2	PC_3	etc.

STATISTICS (Continued)

The term "rth m-tile" ($r = 1, \ldots, m$) is also used to denote the class interval extending from the $(r - 1)$st to rth m-tile mark as defined above.

Mm, the **mid-mean,** =

$$2 \sum_{Q_1 \leq x_i \leq Q_3} f_i x_i / N = \sum_{Q_1 \leq x_i \leq Q_3} f_i x_i \Big/ \sum_{Q_1 \leq x_i \leq Q_3} f_i.$$

When each x_i is positive, and not all are equal, one always has $0 < \min < GM < \bar{x} < RMS < \max$.

For moderately-skewed distributions, one has approximately $Mo - \bar{x} = 3(Md - \bar{x})$, or $3Md = Mo + 2\bar{x}$.

Measures of Dispersion and Skewness

Here A is an arbitrary reference value, usually a convenient integral measure near $\bar{x}$.

ν_k, kth **moment about** A, $= \Sigma f_i(x_i - A)^k/N$, $(k = 0, 1, \ldots)$.

$\nu_0 = 1$, $\nu_1 = \bar{x} - A$. ν_2 as function of A is minimum for $A = \bar{x}$.

μ_k, kth **moment about** $\bar{x}$, $= \Sigma f_i(x_i - \bar{x})^k/N$, $(k = 0, 1, \ldots)$.

$$\begin{aligned}
\mu_0 &= 1, \\
\mu_1 &= 0, \\
\mu_2 &= \nu_2 - \nu_1^2 \ (\mu_2 = \text{variance}), \\
\mu_3 &= \nu_3 - 3\nu_1\nu_2 + 2\nu_1^3, \\
\mu_4 &= \nu_4 - 4\nu_1\nu_3 + 6\nu_1\nu_2^2 - 3\nu_1^4. \\
\beta_1 &= \mu_3^2/\mu_2^3,\ \beta_2 = \mu_4/\mu_2^2.
\end{aligned}$$

σ, **standard deviation,** $= \sqrt{\mu_2}$.

$\alpha_3/2$, **momental skewness;** $\alpha_3 = \sqrt{\beta_1} = \mu_3/\sigma^3$.

$(\alpha_4 - 3)/2$, **kurtosis;** $\alpha_4 = \beta_2$.

MD, **mean deviation** (from the mean), $= \Sigma f_i|x_i - \bar{x}|/N$

$$= 2\left[\bar{x} \sum_{x_i < \bar{x}} f_i - \sum_{x_i < \bar{x}} f_i x_i\right]/N.$$

(This latter form is convenient for computation.)

s, **quartile deviation,** $= |Q_3 - Q_1|/2$.

$P.E.$, **probable error,** $= 0.6745\sigma$.

V, **coefficient of variation,** $= 100\sigma/\bar{x}\ \%$.

Pearson's measure of skewness $= (\bar{x} - Mo)/\sigma$. (Usually approximately $\alpha_3/2$.)

Bowley's measure of skewness $= (Q_3 - 2Md + Q_1)/(2s)$.

(Bowley's measure of skewness lies between -1 and $+1$.)

STATISTICS (Continued)

The Class Interval

$$\Delta x_i = x_{i+1} - x_i.$$

For equi-spaced arguments, $\Delta x_i = h$, the **length of the class interval**, x_i is the **mid-value** or **class mark**. The interval from $x_i - (h/2)$ to $x_i + (h/2)$ is the **class interval** with these as given **initial** and **terminal end values.**

$$u_i = (x_i - A)/h.$$
$$\bar{u} = \Sigma f_i u_i / N,\ \bar{x} = h\bar{u} + A.$$
$$(\mu_k)_x = h^k(\mu_k)_u,\ (k = 0, 1, \ldots).$$
$$\sigma_u^2 = [\Sigma f_i u_i^2/N] - \bar{u}^2,\ \sigma_x = h\sigma_u.$$
$$(\beta_1)_x = (\beta_1)_u,\ (\beta_2)_x = (\beta_2)_u.$$

Sheppard's corrections (to correct approximately for the error due to treating all elements in a given class interval of length h as though concentrated at the class mark).

For μ_0, μ_1, μ_3, no corrections.

In x-units,

corrected $(\mu_2)_x$ = uncorrected $(\mu_2)_x - h^2/12$,

corrected $(\mu_4)_x$ = uncorrected $(\mu_4)_x - h^2$ uncorrected $(\mu_2)_x/2 + 7h^4/240$.

In u-units, replace h by 1 in the formulae given above.

Least Squares

The **normal equations** for finding coefficients, $a_0, a_1, \ldots, a_m$, in fitting a curve of the form $y = a_0 + a_1 x + \ldots + a_m x^m$ to data (X_i, Y_i), $i = 1, \ldots, n$, $(n > m)$, are $m + 1$ in number as follows:

$$\Sigma Y_i = a_0 n + a_1 \Sigma X_i + a_2 \Sigma X_i^2 + \ldots + a_m \Sigma X_i^m,$$
$$\Sigma X_i Y_i = a_0 \Sigma X_i + a_1 \Sigma X_i^2 + a_2 \Sigma X_i^3 + \ldots + a_m \Sigma X_i^{m+1},$$
$$\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots$$
$$\Sigma X_i^m Y_i = a_0 \Sigma X_i^m + a_1 \Sigma X_i^{m+1} + a_2 \Sigma X_i^{m+2} + \ldots + a_m \Sigma X_i^{2m}.$$

Deviation from fitted curve,

$$d_i = Y_i - (a_0 + a_1 X_i + \ldots + a_m X_i^m).$$

$$\Sigma d_i^2 = \Sigma Y_i^2 - (a_0 \Sigma Y_i + a_1 \Sigma X_i Y_i + \ldots + a_m \Sigma X_i^m Y_i).$$

For $z = ab^x$, use $y = \log z$, $a_0 = \log a$, $a_1 = \log b$.

For $z = at^p$, use $y = \log z$, $a_0 = \log a$, $a_1 = p$, $x = \log t$.

S_y, **standard error of estimate,** = root-mean-square of the y-deviations about a fitted curve $= \sqrt{\Sigma d_i^2/n}$.

Simple Correlation

Product Moment Method

Given n equi-spaced measurements X_i, $i = 1, 2, \ldots, n$, with $h = X_{i+1} - X_i$, $x_i = X_i - \bar{X}$; and m equi-spaced measurements Y_j, $j = 1, 2, \ldots, m$, with $k = Y_{j+1} - Y_j$, $y_j = Y_j - \bar{Y}$; and a weight (frequency, probability, etc.) e_{ij} (≥ 0), associated with (X_i, Y_j). Here e_{ij} is an entry in the table.

STATISTICS (Continued)

$$f_i = \sum_j e_{ij},\ g_j = \sum_i e_{ij}.$$

$$N = \sum_{ij} e_{ij} = \sum_i f_i = \sum_j g_j. \quad \text{(Check)}$$

$$\bar{x} = \sum_{ij} e_{ij} X_i / N = \sum_i f_i X_i / N;\ \bar{y} = \sum_{ij} e_{ij} Y_j / N = \sum_j g_j Y_j / N.$$

Let A and B be arbitrary reference values, usually convenient integral measures near $\bar{X}$ and $\bar{Y}$, respectively.

$$u_i = (X_i - A)/h,\ v_j = (Y_j - B)/k;$$

$$\bar{u} = \Sigma f_i u_i / N,\ \bar{X} = h\bar{u} + A,\ \bar{v} = \Sigma g_j v_j / N,\ \bar{Y} = k\bar{v} + B.$$

$$\left.\begin{aligned} \sigma_u^2 &= (\mu_2)_u = (\Sigma f_i u_i^2/N) - \bar{u}^2,\ \sigma_x = h\sigma_u. \\ \sigma_v^2 &= (\mu_2)_v = (\Sigma g_j v_j^2/N) - \bar{v}^2,\ \sigma_y = k\sigma_v. \end{aligned}\right\} \text{Apply Sheppard's corrections.}$$

$$U_j = \sum_i e_{ij} u_i,\ V_i = \sum_j e_{ij} v_j,\ P = \sum u_i V_i = \sum v_j U_j. \quad \text{(Check)}$$

$$p_{uv} = \sum_{ij} e_{ij}(u_i - \bar{u})(v_j - \bar{v})/N$$

$$= (P/N) - \bar{u}\bar{v}.$$

$$p_{xy} = hkp_{uv}.$$

$r = p_{uv}/(\sigma_u\sigma_v) = p_{xy}/(\sigma_x\sigma_y)$ **(product-moment) coefficient of correlation.** In every case $-1 \leq r \leq 1$.

$Y - \bar{Y} = r\dfrac{\sigma_y}{\sigma_x}(X - \bar{X})$, or $y = r\dfrac{\sigma_y}{\sigma_x}x$, **regression line of y on x.**

$X - \bar{X} = r\dfrac{\sigma_x}{\sigma_y}(Y - \bar{Y})$, or $x = r\dfrac{\sigma_x}{\sigma_y}y$, **regression line of x on y.**

$A = 24$, $B = 15$,
$h = 4$, $k = 3$,
$N = \Sigma f_i = \Sigma g_j = 50$,
$\Sigma f_i u_i = -9$, $\Sigma g_j v_j = 35$,
$\Sigma f_i u_i^2 = 79$, $\Sigma g_j v_j^2 = 91$,
$P = \Sigma u_i V_i = \Sigma v_j U_j = 43$.

$\bar{u} = -9/50 = -.18 \qquad \bar{v} = 35/50 = .70$

$\sigma_u^2 = (79/50) - (-.18)^2 - .083 = 1.173, \qquad \sigma_u = 1.083$

$\sigma_v^2 = (91/50) - (.70)^2 - .083 = 1.247, \qquad \sigma_v = 1.117$

$p_{uv} = (43/50) - (-.18)(.70) = +0.986$

$r = +0.986/(1.083 \times 1.117) = +.815 \qquad$ Ans. $r = +.815$

STATISTICS (Continued)

Rank Difference Method

Given n corresponding pairs of measured items (X_i, Y_i), $(i = 1, \ldots, n)$. Let (u_i, v_i) be the corresponding rank numbers. Here $u_i = 1$ for the largest X_i, 2 for the next largest X_i, etc., and similarly $v_i = 1$ for the largest Y_i, 2 for the next largest Y_i, etc. $\rho = 1 - \dfrac{6\Sigma(u_i - v_i)^2}{n(n^2 - 1)}$, **(rank difference) coefficient of correlation.** In every case $-1 \leq \rho \leq 1$. Check: $\Sigma(u_i - v_i) = 0$.

Example of Computation for Rank-Difference Coefficient of Correlation

X_i	Y_i	u_i	v_i	$u_i - v_i$	$(u_i - v_i)^2$

66	34	8	9	−1	1	
63	32	10	10	0	0	
74	45	4	4	0	0	$\rho = 1 - \dfrac{6 \times 62}{10(10^2 - 1)}$
79	50	1	2	−1	1	
69	37	7	7	0	0	
77	35	2	8	−6	36	$= +0.63$
65	42	9	5	+4	16	
71	40	6	6	0	0	Ans. $\rho = +.63$
73	48	5	3	+2	4	
$N = 10$				0	62	

Probability

If among $a + b$ equi-probable and mutually exclusive events, a are regarded as favorable and b unfavorable, then for a single trial

p, probability of favorable outcome, $= \dfrac{a}{a + b}$,

q, probability of unfavorable outcome, $= 1 - p = \dfrac{b}{a + b}$.

The successive terms in the binomial expansion $(p + q)^n = \sum\limits_r \binom{n}{r} p^{n-r}q^r$ give the respective probabilities than in n trials, the event will be favorable exactly $n - r$ times, $r = 0, \ldots, n$.

The mean number of favorable events is np, of unfavorable, nq; the standard deviation is $\sigma = \sqrt{npq}$, $\alpha_3 = (p - q)/\sigma$ (the positive direction being that of increasing unfavorability).

Normal curve (x measured in σ-units from the mean, and with area = 1):

$$y = \frac{1}{\sqrt{2\pi}} e^{-x^2/2} = 0.3989e^{-x^2/2}.$$

STATISTICS (Continued)

MD (mean deviation from the mean) $= \sigma\sqrt{2/\pi} = 0.7979\sigma$.
s (quartile deviation from the mean) $= 0.6745\sigma = 0.845\ MD$.
Percentage areas, under normal curve, for successive class intervals measured from the mean:

Multiples of σ: 34 %, 14 %, 2 %.
Multiples of s: 25 %, 16 %, 7 %, 2 %.

Normal surface (x measured in σ_x-units y in σ_y-units from their means),

$$z = \frac{1}{2\pi\sqrt{1 - r^2}} e^{-(x^2 - 2rxy + y^2)/[2(1-r^2)]}.$$

Goodness of Fit. For a universe of objects falling into n mutually exclusive classes with class marks, $x_i (i = 1, 2, \ldots, n)$, let p_i be the probability for the ith class. Given a sample of N items, with f_i items in the ith class ($\Sigma f_i = N$), the probability that a random sample of N items gives no better fit, expressed in terms of n and χ^2 ("Chi square"), $= \Sigma(f_i - Np_i)^2/(Np_i)$, is given by a table, portions of which are as follows:

Probability that a Random Sample Gives no Better Fit

n \ χ^2	1	2	3	4	6	8	10	15	20

MENSURATION FORMULÆ

Plane Figures Bounded by Straight Lines

The **area of a triangle** whose base is b and altitude h

$$= \frac{hb}{2}.$$

The area of a **triangle** with angles A, B, and C and sides opposite a, b, and c, respectively

$$= \tfrac{1}{2}ab \sin C.$$

or $$= \sqrt{s(s-a)(s-b)(s-c)},$$
where $s = \frac{1}{2}(a + b + c)$.

A **rectangle** with sides a and b has an area $= ab$.

The area of a **parallelogram** with side b and the perpendicular distance to the parallel side h

$$= bh.$$

The area of a **parallelogram** with sides a and b and the included angle θ

$$= ab \sin \theta.$$

The area of a **rhombus** with diagonals c and d,

$$= \tfrac{1}{2}cd.$$

The area of a **trapezoid** whose parallel sides are a and b and altitude h

$$= \tfrac{1}{2}(a + b)h.$$

The area of any **quadrilateral** with diagonals a and b and the angle between them θ

$$= \tfrac{1}{2}ab \sin \theta.$$

The area of a **regular polygon** with n sides, each of length l,

$$= \tfrac{1}{4}nl^2 \cot \frac{180}{n}.$$

For a regular polygon of n sides, each side of length l, the radius of the **inscribed circle**,

$$= \frac{l}{2} \cot \frac{180}{n}.$$

The radius of the **circumscribed circle**,

$$= \frac{l}{2} \operatorname{cosec} \frac{180}{n}.$$

Area, Radius of Inscribed and Circumscribed Circles for Regular Polygons

l = length of one side.

Name.	Number of sides.	Area.	Radius of inscribed circle.	Radius of circumscribed circle.
Triangle, equilateral	3	$0.43301l^2$	$0.28867l$	$0.57735l$
Square............	4	$1.00000l^2$	$0.50000l$	$0.70710l$
Pentagon..........	5	$1.72048l^2$	$0.68819l$	$0.85065l$
Hexagon...........	6	$2.59808l^2$	$0.86602l$	$1.0000l$
Heptagon..........	7	$3.63391l^2$	$1.0383l$	$1.1523l$
Octagon...........	8	$4.82843l^2$	$1.2071l$	$1.3065l$
Nonagon...........	9	$6.18182l^2$	$1.3737l$	$1.4619l$
Decagon...........	10	$7.69421l^2$	$1.5388l$	$1.6180l$
Undecagon.........	11	$9.36564l^2$	$1.7028l$	$1.7747l$
Dodecagon.........	12	$11.19615l^2$	$1.8660l$	$1.9318l$

Radius of circle inscribed in any triangle, whose sides are a, b, and c, where $s = \frac{1}{2}(a + b + c)$

$$= \frac{\sqrt{s(s-a)(s-b)(s-c)}}{s}.$$

The radius of the circumscribed circle

$$= \frac{abc}{4\sqrt{s(s-a)(s-b)(s-c)}}.$$

The perimeter of a polygon inscribed in a circle of radius r, where n is the number of sides,

$$= 2nr \sin \frac{\pi}{n}. \qquad (\pi \text{ radians} = 180°)$$

The area of the inscribed polygon,

$$= \tfrac{1}{2}nr^2 \sin \frac{2\pi}{n}.$$

The perimeter of a polygon circumscribed about a circle of radius r, number of sides n

$$= 2nr \tan \frac{\pi}{n}.$$

The area of the circumscribed polygon

$$= nr^2 \tan \frac{\pi}{n}.$$

Plane Figures Bounded by Curved Lines

The **circumference of a circle** whose radius is r and diameter $d (d = 2r)$

$$= 2\pi r = \pi d. \qquad (\pi = 3.14159)$$

The area of a circle

$$= \pi r^2 = \tfrac{1}{4}\pi d^2 = .7854 d^2.$$

The length of an arc of a circle for an arc of θ degrees

$$= \frac{\pi r \theta}{180}.$$

NOTE. — In this and following similar formulæ r denotes the radius of the circle, (OC, Fig. 1).

For an arc of θ radians the length

$$= r\theta.$$

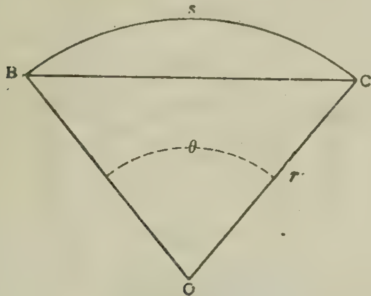

FIG 1.

The length of a chord subtending an angle θ

$$= 2r \sin \tfrac{1}{2}\theta.$$

The **area of a sector** where θ is the angle between the radii in degrees

$$= \frac{\pi r^2 \theta}{360}.$$

If s is the length of the arc, the area of the sector

$$= \frac{sr}{2}.$$

The **area of a segment** where θ is the angle between the two radii in degrees

$$= \frac{\pi r^2 \theta}{360} - \frac{r^2 \sin \theta}{2}.$$

If θ is in radians the area $= \frac{1}{2}r^2(\theta - \sin\theta)$.

The area of the segment of a circle

$$= \frac{\pi r^2}{2} - \left[x\sqrt{r^2 - x^2} + r^2 \sin^{-1}\left(\frac{x}{r}\right) \right]$$

where r is the radius of the circle and x the perpendicular distance of the chord from the center. The angle must be expressed in radians.

The area of the ring between two circles of radius r_1 and r_2, one of which encloses the other,

$$= \pi(r_1 + r_2)(r_1 - r_2).$$

The two circles are not necessarily concentric.

Area of the sector of an annulus. (Fig. 2.)—If angle $GOH = \theta$ and the lines GO and $JO = r_1$ and r_2 respectively, the area $GHIJ = \frac{1}{2}\theta(r_1 + r_2)(r_1 - r_2)$.

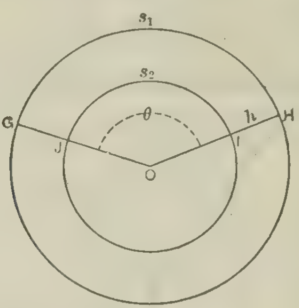

Fig. 2

If s_1 = the length of the arc GH and s_2 = the arc JI and $h = HI = r_1 - r_2$, the area $GHIJ = \frac{1}{2}h(s_1 + s_2)$.

The circumference of an ellipse whose semiaxes are a and b

$$= 2\pi\sqrt{\frac{a^2 + b^2}{2}}, \text{ approximately.}$$

The area of an ellipse $= \pi ab$.

The length of the arc of a parabola, as arc SPQ in Fig. 3, where $x = PR$, and $y = QR$

$$= 2\sqrt{y^2 + \frac{4x^2}{3}}, \text{ approximately.}$$

The area of the section of the parabola $PQRS$, $= \frac{4}{3}xy$.

Solids Bounded by Planes

The lateral area of a regular prism = perimeter of a right section $\times$ the length.

The volume of a regular prism = area of base $\times$ the altitude.

The lateral area of a regular pyramid, slant height l, length of one side of base a, and a number of sides n,

$$= \tfrac{1}{2}nal.$$

The volume of a pyramid = $\frac{1}{3}$ area of base $\times$ altitude.

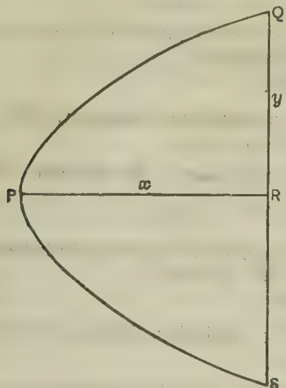

FIG. 3.

Surface and Volume of Regular Polyhedra

Surface and volume of regular polyhedra in terms of the length of one edge l.

Name.	Nature of surface.	Surface.	Volume.
Tetrahedron . . .	4 equilateral triangles	$1.73205l^2$	$0.11785l^3$
Hexahedron or cube	6 squares	$6.00000l^2$	$1.00000l^3$
Octahedron	8 equilateral triangles	$3.46410l^2$	$0.47140l^3$
Dodecahedron .	12 pentagons	$20.64578l^2$	$7.66312l^3$
Icosahedron . . .	20 equilateral triangles	$8.66025l^2$	$2.18170l^3$

Solids Bounded by Curved Surfaces

The surface of a sphere of radius r and diameter $d (= 2r)$

$$= 4\pi r^2 = \pi d^2 = 12.57r^2.$$

The volume of a sphere

$$= \tfrac{4}{3}\pi r^3 = \tfrac{1}{6}\pi d^3 = 4.189r^3.$$

The area of a lune on the surface of a sphere of radius r, included between two great circles whose inclination is θ radians.

$$= 2r^2\theta.$$

The area of a spherical triangle whose angles are A, B, and C (radians) on a sphere of radius r

$$= (A + B + C - \pi)r^2.$$

The area of a spherical polygon of n sides where θ is the sum of its angles in radians

$$= [\,\theta - (n - 2)\pi\,]r^2.$$

The area of the curved surface of a spherical segment of height h, radius of sphere r

$$= 2\pi\, rh.$$

The volume of a spherical segment, data as above

$$= \tfrac{1}{3}\pi h^2\,(3r - h).$$

If a = radius of the base of the segment, the volume

$$= \tfrac{1}{6}\pi h\,(h^2 + 3a^2).$$

The curved surface of a right cylinder where r = the radius of the base and h, the altitude,

$$= 2\pi rh.$$

The volume of a cylinder, data as above,

$$= \pi r^2 h.$$

The curved surface of a right cone whose altitude is h and radius of base r

$$= \pi r\,\sqrt{r^2 + h^2}.$$

The volume of a cone, data as above,

$$= \frac{\pi}{3}r^2 h = 1.047\ r^2 h.$$

The curved surface of the frustum of a right cone, radius of base r_1, of top r_2 and altitude h,

$$= \pi(r_1 + r_2)\ \sqrt{h^2 + (r_1 - r_2)^2}.$$

The volume of the frustum of a cone, data as above,

$$= \pi\frac{h}{3}\,(r_1^2 + r_1\,r_2 + r_2^2).$$

The oblate spheroid is formed by the rotation of an ellipse about its minor axis. If a and b are the major and minor semi-axes respectively, and e the eccentricity, the surface

$$= 2\pi a^2 + \pi\frac{b^2}{e}\log_e\frac{1 + e}{1 - e},$$

and volume $= \tfrac{4}{3}\pi a^2 b.$

The **prolate spheroid** is formed by the rotation of an ellipse about its major axis ($2a$), data as above.

Surface $= 2\pi b^2 + 2\pi \frac{ab}{e} \sin^{-1} e,$

volume $= \frac{4}{3}\pi ab^2.$

SIMPSON'S RULE FOR IRREGULAR AREAS

Divide the area into n panels (where n is some even number) by means of $n+1$ parallel lines, or ordinates, drawn at constant distance h apart; and denote the lengths of the ordinates by $y_0, y_1, y_2, \ldots y_n$. The first and last ordinate may be zero. The area will then be:

$$A = \tfrac{1}{3}h[(y_0+y_n)+4(y_1+y_3+y_5 \cdots)+2(y_2+y_4+y_6 \cdots)]$$

The greater the number of divisions, the more accurate the result. Simpson's rule may be applied to finding volumes if the ordinates y_0, y_1, y_2 be interpreted as the areas of plane sections, at constant distance h apart.

PRISMOIDAL FORMULA

The volume of a solid figure extending between two parallel planes in which the area of every cross-section parallel to those planes is a quadratic function of the distance of the section from a fixed plane parallel to them is given by the equation

$$V = \tfrac{1}{6}H(S_0+4S_1+S_2)$$

where H is the distance between the two limiting parallel planes; S_0 and S_2 the cross-sections in these planes (lower and upper bases) and S_1 the cross-section of the mid section. The formula applies to such figures as the cone, sphere, ellipsoid and prismoid.

TRIGONOMETRIC FUNCTIONS IN A RIGHT-ANGLED TRIANGLE

If A, B, and C are the vertices (C the right angle), and a, b, and h the sides opposite respectively,

$$\text{sine } A = \sin A = \frac{a}{h}, \qquad \text{cosine } A = \cos A = \frac{b}{h},$$

$$\text{tangent } A = \tan A = \frac{a}{b}, \qquad \text{cotangent } A = \cot A = \text{ctn } A = \frac{b}{a},$$

$$\text{secant } A = \sec A = \frac{h}{b}, \qquad \text{cosecant } A = \csc A = \frac{h}{a}.$$

$$\text{exsecant } A = \text{exsec } A = \sec A - 1$$

$$\text{versine } A = \text{vers } A = 1 - \cos A$$

$$\text{coversine } A = \text{covers } A = 1 - \sin A$$

$$\text{haversine } A = \text{hav } A = \tfrac{1}{2} \text{ vers } A$$

RELATIONS OF THE FUNCTIONS

$$\sin x = \frac{1}{\operatorname{cosec} x}. \qquad \operatorname{cosec} x = \frac{1}{\sin x}.$$

$$\cos x = \frac{1}{\sec x}. \qquad \sec x = \frac{1}{\cos x}.$$

$$\tan x = \frac{1}{\cot x} = \frac{\sin x}{\cos x}. \qquad \sin^2 x + \cos^2 x = 1$$

$$1 + \tan^2 x = \sec^2 x$$

$$\cot x = \frac{1}{\tan x} = \frac{\cos x}{\sin x}. \qquad 1 + \cot^2 x = \operatorname{cosec}^2 x$$

$$\sin x = \sqrt{1 - \cos^2 x}. \qquad \cos x = \sqrt{1 - \sin^2 x}.$$

$$\tan x = \sqrt{\sec^2 x - 1}. \qquad \sec x = \sqrt{\tan^2 x + 1}.$$

$$\cot x = \sqrt{\operatorname{cosec}^2 x - 1}. \qquad \operatorname{cosec} x = \sqrt{\cot^2 x + 1}.$$

$$\sin x = \cos (90 - x) = \sin (180 - x).$$

$$\cos x = \sin (90 - x) = -\cos (180 - x).$$

$$\tan x = \cot (90 - x) = -\tan (180 - x).$$

$$\cot x = \tan (90 - x) = -\cot (180 - x).$$

$$\operatorname{cosec} x = \cot \frac{x}{2} - \cot x.$$

FUNCTIONS OF SUMS OF ANGLES

$$\sin (x + y) = \sin x \cos y + \cos x \sin y.$$

$$\sin (x - y) = \sin x \cos y - \cos x \sin y.$$

$$\cos (x + y) = \cos x \cos y - \sin x \sin y.$$

$$\cos (x - y) = \cos x \cos y + \sin x \sin y.$$

$$\tan (x + y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}.$$

$$\tan (x - y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}.$$

FUNCTIONS OF MULTIPLE ANGLES

$\sin 2x = 2 \sin x \cos x.$
$\cos 2x = \cos^2 x - \sin^2 x = 2 \cos^2 x - 1 = 1 - 2 \sin^2 x.$
$\sin 3x = 3 \sin x - 4 \sin^3 x.$
$\cos 3x = 4 \cos^3 x - 3 \cos x.$
$\sin 4x = 8 \cos^3 x \sin x - 4 \cos x \sin x.$
$\cos 4x = 8 \cos^4 x - 8 \cos^2 x + 1.$
$\sin 5x = 5 \sin x - 20 \sin^3 x + 16 \sin^5 x.$
$\cos 5x = 16 \cos^5 x - 20 \cos^3 x + 5 \cos x.$
$\sin 6x = 32 \cos^5 x \sin x - 32 \cos^3 x \sin x + 6 \cos x \sin x.$
$\cos 6x = 32 \cos^6 x - 48 \cos^4 x + 18 \cos^2 x - 1.$

$$\tan 2x = \frac{2 \tan x}{1 - \tan^2 x}.$$

$$\cot 2x = \frac{\cot^2 x - 1}{2 \cot x}.$$

$$\tan 3x = \frac{3 \tan x - \tan^3 x}{1 - 3 \tan^2 x}.$$

$$\sin \tfrac{1}{2}x = \pm \sqrt{\frac{1 - \cos x}{2}}.$$

$$\cos \tfrac{1}{2}x = \pm \sqrt{\frac{1 + \cos x}{2}}.$$

$$\tan \tfrac{1}{2}x = \pm \sqrt{\frac{1 - \cos x}{1 + \cos x}} = \frac{1 - \cos x}{\sin x} = \frac{\sin x}{1 + \cos x}.$$

MISCELLANEOUS RELATIONS

$\sin x \pm \sin y = 2 \sin \tfrac{1}{2}(x \pm y) . \cos \tfrac{1}{2}(x \mp y).$
$\cos x + \cos y = 2 \cos \tfrac{1}{2}(x + y) . \cos \tfrac{1}{2}(x - y).$
$\cos x - \cos y = -2 \sin \tfrac{1}{2}(x + y) . \sin \tfrac{1}{2}(x - y).$

$$\tan x \pm \tan y = \frac{\sin (x \pm y)}{\cos x . \cos y}. \quad \cot x \pm \cot y = \frac{\pm \sin (x \pm y)}{\sin x \cdot \sin y}.$$

$$\frac{1 + \tan x}{1 - \tan x} = \tan (45 + x) \qquad \frac{\cot x + 1}{\cot x - 1} = \cot (45 - x)$$

$$\frac{\sin x \pm \sin y}{\cos x + \cos y} = \tan \tfrac{1}{2}(x \pm y).$$

$$\frac{\sin x \pm \sin y}{\cos x - \cos y} = -\cot \tfrac{1}{2}(x \mp y).$$

$$\frac{\sin x + \sin y}{\sin x - \sin y} = \frac{\tan \tfrac{1}{2}(x + y)}{\tan \tfrac{1}{2}(x - y)}.$$

$\sin^2 x - \sin^2 y = \sin (x + y) . \sin (x - y).$
$\cos^2 x - \cos^2 y = -\sin (x + y) \sin (x - y).$
$\cos^2 x - \sin^2 y = \cos (x + y) \cos (x - y).$

RELATIONS BETWEEN SIDES AND ANGLES OF ANY PLANE TRIANGLE

In a triangle with angles A, B, and C and sides opposite a, b, and c respectively,

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}.$$

$$a^2 = b^2 + c^2 - 2bc \cos A.$$

$$a = b \cos C + c \cos B.$$

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}.$$

$$\tan \frac{A - B}{2} = \frac{a - b}{a + b} \cot \frac{C}{2}.$$

$$\sin A = \frac{2}{bc}\sqrt{s(s-a)(s-b)(s-c)},$$

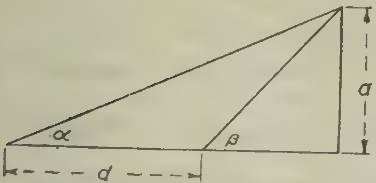
where $s = \frac{1}{2}(a+b+c)$ and $r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}$.

$$\sin \frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}}.$$

$$\cos \frac{A}{2} = \sqrt{\frac{s(s-a)}{bc}}.$$

$$\tan \frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} = \frac{r}{s-a}.$$

$$\frac{a+b}{a-b} = \frac{\sin A + \sin B}{\sin A - \sin B} = \frac{\tan \frac{1}{2}(A+B)}{\tan \frac{1}{2}(A-B)} = \frac{\cot \frac{1}{2} C}{\tan \frac{1}{2}(A-B)}.$$



$$a = \frac{d}{\cot \alpha - \cot \beta}$$

FIG. 5.

RELATIONS IN ANY SPHERICAL TRIANGLE

If A, B and C be the three angles and a, b, and c the opposite sides,

$$\frac{\sin A}{\sin a}=\frac{\sin B}{\sin b}=\frac{\sin C}{\sin c}.$$

$$\cos a=\cos b\cos c+\sin b\sin c\cos A=\frac{\cos b\cos(c\pm\theta)}{\cos\theta}.$$

where $\tan\theta=\tan b\cos A.$

$$\cos A=-\cos B\cos C+\sin B\sin C\cos a.$$

$$\sin\tfrac{1}{2}A=\sqrt{\frac{\sin(s-b)\sin(s-c)}{\sin b\sin c}}.$$

where $s=\tfrac{1}{2}(a+b+c).$

$$\cos\tfrac{1}{2}A=\sqrt{\frac{\sin s\sin(s-a)}{\sin b\sin c}}.$$

$$\tan\tfrac{1}{2}A=\frac{r}{\sin(s-a)}.$$

where $r=\sqrt{\dfrac{\sin(s-a)\sin(s-b)\sin(s-c)}{\sin s}}.$

$$\cos\tfrac{1}{2}a=\sqrt{\frac{\cos(S-B)\cos(S-C)}{\sin B\sin C}}.$$

where $S=\tfrac{1}{2}(A+B+C).$

$$\sin\tfrac{1}{2}a=\sqrt{-\frac{\cos S\cos(S-A)}{\sin B\sin C}}.$$

$$\tan\tfrac{1}{2}a=R\cos(S-A)$$

where $R=\sqrt{\dfrac{-\cos S}{\cos(S-A)\cos(S-B)\cos(S-C)}}.$

$$\frac{\tan\frac{a+b}{2}}{\tan\frac{c}{2}}=\frac{\cos\frac{A-B}{2}}{\cos\frac{A+B}{2}},\quad\frac{\tan\frac{A+B}{2}}{\cot\frac{c}{2}}=\frac{\cos\frac{a-b}{2}}{\cos\frac{a+b}{2}}.$$

$$\frac{\tan\frac{a-b}{2}}{\tan\frac{c}{2}}=\frac{\sin\frac{A-B}{2}}{\sin\frac{A+B}{2}},\quad\frac{\tan\frac{A-B}{2}}{\cot\frac{c}{2}}=\frac{\sin\frac{a-b}{2}}{\sin\frac{a+b}{2}}$$

ANALYTICAL GEOMETRY

The distance between two points x_1, y_1, and x_2, y_2, — **rectangular coördinates:**

$$d = \pm \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

For polar coördinates and points r_1, θ_1, and r_2, θ_2:

$$d = \pm \sqrt{r_1^2 + r_2^2 - 2r_1r_2 \cos(\theta_1 - \theta_2)}$$

The area of a triangle whose vertices are x_1, y_1; x_2, y_2, and x_3, y_3:

$$A = \tfrac{1}{2}(x_1y_2 - x_2y_1 + x_2y_3 - x_3y_2 + x_3y_1 - x_1y_3)$$

For polar coördinates and vertices, r_1, θ_1; r_2, θ_2, and r_3, θ_3:

$$A = \tfrac{1}{2}\{(r_1r_2 \sin(\theta_2 - \theta_1) + r_2r_3 \sin(\theta_3 - \theta_2) + r_3r_1 \sin(\theta_1 - \theta_3)\}$$

The equation of a straight line where m is the tangent of the angle of inclination and c, the distance of intersection with the Y axis from the origin:

$$y = mx + c$$

If a line of inclination m passes through the point x_1, y_1 its equation is:

$$y - y_1 = m(x - x_1)$$

The equation of a line through the points x_1, y_1, and x_2, y_2 is:

$$\frac{y - y_1}{y_2 - y_1} = \frac{x - x_1}{x_2 - x_1}$$

If the intercepts on the X and Y axes are a and b respectively, the equation is:

$$\frac{x}{a} + \frac{y}{b} = 1$$

If the length of the perpendicular from the origin is p and its angle of inclination θ the equation is:

$$x \cos\theta + y \sin\theta = p$$

General equation of the straight line:

$$Ax + By + C = 0$$

The equation of a circle whose center is at a, b, and whose radius is c:

$$(x - a)^2 + (y - b)^2 = c^2$$

If the origin is at the center:

$$x^2 + y^2 = c^2$$

The polar equation of a circle with the origin on the circumference and its center at point c, α:

$$r = 2c \cos(\theta - \alpha).$$

If the origin is not on the circumference, the radius a and the center at a point l, α, the equation becomes:

$$a^2 = r^2 + l^2 - 2rl \cos(\theta - \alpha) .$$

The equation of a parabola with the origin at the vertex, where f is the distance from the focus to the vertex:

$$y^2 = 4fx$$

If p is the semi-latus rectum $(=2f)$ the equation is:

$$y^2 = 2px$$

The polar equation where the pole is at the focus and l the semi-latus rectum is:

$$\frac{l}{r} = 1 - \cos\theta$$

If the pole is at the vertex and p as above:

$$r = \frac{4p\cos\theta}{\sin^2\theta}$$

The equation of the ellipse with the origin at the center and semi-axes a and b:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Polar equation where the pole is at the center:

$$r^2 = \frac{a^2b^2}{a^2\sin^2\theta + b^2\cos^2\theta}$$

The equation of the hyperbola with the origin at the center, semi-axes a and b:

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

Polar equation, pole at center:

$$r^2 = \frac{a^2b^2}{a^2\sin^2\theta - b^2\cos^2\theta}$$

PROPERTIES AND PHYSICAL CONSTANTS

ATOMIC WEIGHTS

ISOTOPES

Compiled by F. B. Haynes

Where no abundance is given the isotopes are listed in order of decreasing abundance unless otherwise noted.

In several cases the results of different observers are included, appearing in the table as a second group of isotopes. This will explain the duplication of mass numbers under the same element.

Parentheses indicate approximation or estimate.

2G indicates that there are two isotopes having mass numbers greater than the following mass number.

2L indicates two less than the preceding mass number, etc.

S indicates single.

Element	Symbol	Atomic Number	Atomic Weight	Mass Number	Abundance	Reference

THE ELEMENTS

Revised by Harrison Hale

Actinium (Gr. *aktis*, *aktinos*, beam or ray), Ac; at. wt. 227 (approx.); at. no. 89. Discovered in 1899 by Andre Debierne and independently by F. Giesel in 1902. Radioactive, decomposing into other elements of smaller atomic weight at certain intervals of time. (See Radioactive Elements.)

Alabamine (State of Alabama), Ab; at. wt. 221; at. no. 85; valence 1, 3, 5 or 7. Discovered in 1931 by Dr. Fred Allison and co-workers at Alabama Polytechnic Institute, by the magneto-optic method of analysis. Minima for HAb, HAbO, $HAbO_2$, $HAbO_3$ and $HAbO_4$ were measured. Ab can be oxidized in alkaline solution but more readily in acid solution. The peralabamates are the most stable compounds.

Aluminum (L *alumen*, alum), Al; at. wt. 26.97; at. no. 13; m.p. 658.7° C; b.p. 1800° C; sp. gr. 2.70 (20°); valence 3. Discovered in 1827 by Wöhler; the first really practical electrical method of extraction was patented by Cowles in England and the United States in 1885, but this was finally supplanted by methods of Heroult in France and Hall in America. Aluminum is not found in the metallic form but occurs as silicate in clays, feldspar, etc., as the most abundant metal in the earth's crust. It is extracted chiefly from bauxite, an impure hydrated oxide, by electrolysis of the pure alumina in molten cryolite. Aluminum is a white, somewhat soft metal resembling tin in appearance; among the metals it stands second in the scale of malleability and sixth in ductility. It is but slightly magnetic and is strongly electro-positive, so that in contact with most other metals it rapidly corrodes. The electrical conductivity is about 60% that of copper per area of cross-section, but aluminum is much lighter; it is highly sonorous in the bar but has a weak, cracked sound when cast into a bell. It takes a high polish but this is likely to become frosted in appearance due to the formation of an oxide coating. Alloys with the following metals have been prepared: zinc, copper, magnesium, cerium, beryllium, cobalt, tungsten and molybdenum. Some of these alloys are finding increasing use in airplanes, automobiles and railway coaches. The compounds of aluminum of greatest importance are its oxide and its sulfate. The oxide, alumina, occurs naturally as ruby, sapphire, corundum and emery and is very hard, ranking next to the diamond. In 1856 the price was about $90 a pound; at the time of Hall's discovery in 1886 about $5; in 1935, 23¢.

Antimony (L. *antimonium*), Sb (L. *stibium*, mark); at. wt. 121.76; at. no. 51; m.p. 630° C; b.p. 1635 ± 8° C; sp. gr. 6.68 (25°); valence 3 or 5. Discovered in 1450 by Johann Thölden of Hesse, who wrote under the name of Basil Valentine. Antimony is a metallic element occurring native in rare instances but derived chiefly from *stibnite* or gray antimony ore (Sb_2S_3), *kermesite* or red antimony ($2Sb_2S_3.Sb_2O_3$), *valentinite* or white

antimony (Sb_2O_3), *senarmontite* (Sb_2O_3), *cervantite* ($Sb_2O_3.Sb_2O_2$), and certain ores of gold, silver and lead. It is extracted from the sulfide by roasting to the oxide, which is reduced by salt and scrap iron; from the oxides it is also prepared by reduction with carbon. Antimony is an extremely brittle metal of a flaky, crystalline texture, blue-white color and metallic luster; hardness, 3 to 3.5; not acted on by air at room temperature, but when heated burns brilliantly with the formation of the white fumes of the oxide Sb_2O_3. It is a poor conductor of heat or electricity. The most important metal alloys include type metal, stereotype metal and Babbitt metal. The principal compounds of antimony are the sulfides, chlorides and tartar emetic. In 1928 the price was 10–11¢ a pound, which dropped to 6¢ in 1933, but was 14½¢ in 1935.

Argon (Gr. *argon*, inactive), A; at. wt. 39.944; at. no. 18; m.p. −189.2° C; b.p. −185.7° C; density 1.782 g/l; valence 0 (does not combine with any other element). Its presence in air was suspected by Cavendish in 1785; discovered by Lord Rayleigh and Sir William Ramsay in 1894. Argon is prepared from air, the atmosphere containing about 0.8% argon. It is 2½ times as soluble in water as nitrogen and has about the same solubility as oxygen; it is best recognized by the characteristic lines in the red end of the spectrum. It is used as a filler for incandescent electric lamps. The price of argon in 1928 was about $18 per 10 cu. ft.

Arsenic [L. *arsenicum*, Gr. *arsenikon*, yellow orpiment (identified with *arsenikos*, male, from the belief that metals were of different sexes), Arab. *az-zernikh*, the orpiment from Persian *zerni* (*zar*, gold)], As; at. wt. 74.91; at. no. 33; m.p. sublimes (500° C m.p. under pressure); b.p. 615° C; sp. gr. 5.73; valence 3 or 5. The amorphous form of arsenic has a sp. gr. of 3.70. It is believed that arsenic was obtained in 1250 by Albertus Magnus. In 1649 Schroeder published two methods of preparing it. It is rarely found native, occurring mostly as *realgar* (As_2S_2), arsenical iron and mispickel or arsenical *pyrites* (FeSAs); it is usually prepared by heating mispickel, the arsenic subliming leaving ferrous sulfide. Arsenic is a steel-gray, very brittle, crystalline, semi-metallic solid which sublimes on heating, being deposited partly as crystals and partly as a black, amorphous solid; it tarnishes in air and when heated is rapidly oxidized to arsenious oxide (As_2O_3). The free element is not considered poisonous, although many of its compounds are extremely so, being used as insecticides. Arsenic is also used in bronzing, pyrotechny, and for hardening and improving the sphericity of shot. The most important compounds are white arsenic or arsenious oxide (As_2O_3), cupric arsenite or Paris green ($CuHAsO_3$), and *orpiment* (As_2S_3). The price of the metal in 1935 was 44¢ a pound.

Barium (Gr. *barys*, heavy), Ba; at. wt. 137.36; at. no. 56; m.p. 850° C; b.p. 1140° C; sp. gr. 3.5 (20° C); valence 2. Baryta was distinguished from lime by Scheele in 1779; the element

was discovered by Sir Humphry Davy in 1808. It is found only in combination with other elements, chiefly in *heavy spar* (sulfate) and *witherite* (carbonate) and is prepared by electrolysis. Barium is a metallic element, soft and silvery white like lead; it belongs to the alkaline earth group resembling calcium chemically. The most important compounds of barium are the peroxide, (BaO_2), chloride ($BaCl_2$), sulfate (permanent white or *blanc fixé*, $BaSO_4$), nitrate ($Ba(NO_3)_2$) and chlorate ($Ba(ClO_3)_2$); the nitrate and chlorate are used in pyrotechny for production of green colors; the sulfate in paint manufacture. The sulfide (BaS) phosphoresces after exposure to light. The compounds are not expensive, and the price of the metal has been reduced to \$7.50–\$10.00 per pound in 1932.

Beryllium (L. fr. *beryl;* also called *Glucinum*, Gr. *glykys*, sweet), Be or Gl; at. wt. 9.02; at. no. 4; m.p. 1350° C; b.p. 1530° C (5 mm); sp. gr. 1.85; valence 2. Discovered as the oxide by Vauquelin in beryl and in emerald in 1798; the metal was isolated in 1828 by Wöhler and Bussy independently. Beryllium aluminum silicates are the chief source of the metal today. It is prepared by electrolysis. It is hard enough to scratch glass, and resembles magnesium in appearance and chemical properties. Its soluble compounds are sweet. Its alloys are strong, light and resistant to corrosion. The metal is widely found and the use of the light alloys is expected to increase with the fall in price, which has ranged from \$80–\$300 per pound according to the degree of purity.

Bismuth (etymology dubious; Ger. *Wismuth*), Bi; at. wt. 209.00; at. no. 83; m.p. 271° C; b.p. 1450° C; sp. gr. 9.78 (20° C); valence 3 or 5. In early times bismuth was confused with tin and lead. Claude Geoffroy showed it to be distinct from lead in 1753. Bismuth is a white, crystalline, brittle metal with a pinkish tinge that occurs in many places free as well as in combination as sulfide, oxide and carbonate; it is extracted from the ore by melting out the free metal, the oxides and sulfides being decomposed by the addition of carbon and iron. Bismuth is also recovered as a by-product in lead smelting. It is a poor conductor of electricity, is very diamagnetic, solidifies with expansion, heated in air burns with a blue flame forming yellow fumes of the oxide; its soluble salts are characterized by forming insoluble basic salts on the addition of water—a property sometimes used in its detection. Bismuth forms many alloys with metals, which are often used for their property of low melting point and because of their expansion on cooling, thus particularly suited for making sharp castings of objects subject to damage by high temperatures. The important compounds of bismuth are the trioxide (Bi_2O_3), and the subnitrate of medicinal use (*pearl white, pearl powder, blanc de fard* and *blanc d'Espagne*). The price of the metal in 1935 was \$1.10 per pound in cases.

Boron (Ar. *būraq*, Pers. *būrah*), B; at. wt. 10.82; at. no. 5; m.p. 2000–2500° C; b.p. sublimes 2550° C; sp. gr. of crystals

2.54, of amorphous variety 2.45; valence 3. Discovered in 1808 by Sir Humphry Davy and by Gay-Lussac and Thenard. Boron is an element found in combination in boric acid, native borax or *tincal*, *boracite* and several other minerals. Boron is obtained by heating boron trioxide with magnesium powder; it has no commercial value. The most important compounds are boric acid or boracic acid (H_3BO_3) and borax ($Na_2B_4O_7.10H_2O$).

Bromine (Gr. *bromos*, stench), Br; at. wt. 79.916; at. no. 35; m.p. −7.2° C; b.p. 58.8° C; density of gas 7.59 g/l, liquid 3.12 (20°); valence 1, 3, 5 or 7. Discovered in 1826 by Balard, but it was not prepared in any quantity until 1860. A member of the halogen group of elements, it is obtained from natural brines by displacement with chlorine or electrolytically; it is the only liquid non-metallic element, a heavy, mobile, reddish-brown liquid, volatilizing readily at room temperatures to a red vapor with a strong disagreeable odor resembling chlorine and having a very irritating effect on the eyes and throat; it is readily soluble in water or carbon disulfide forming a red solution; it is less active than chlorine but more so than iodine; it unites readily with many elements and has a bleaching action; when spilled on the skin it produces painful sores. It is chiefly employed for the preparation of its compounds which are useful in photography, medicine, coal tar derivatives, etc. The most important compounds are the bromides of sodium and potassium. The price in 1935 was 36–38¢ a pound.

Cadmium (Gr. *kadmia*, Cadmean earth), Cd; at. wt. 112.41; at. no. 48; m.p. 320.9° C; b.p. 778° C; sp. gr. 8.65 (20°); valence 2. Discovered in 1817 by Stromeyer from an impurity in zinc carbonate. Cadmium occurs in small quantities associated with zinc. It comes off before zinc in the preparation of the metal, condensing as the brown oxide which is then reduced with carbon. It tarnishes in air and burns when heated, forming the oxide. It is a soft, bluish-white metal, malleable and ductile. It forms a number of salts of which the sulfate ($CdSO_4$) is the most common. Cadmium is a component of one of the lowest melting alloys and is alloyed with silver in electroplating. The price of cadmium in 1935 was 55¢ a pound.

Calcium (L. *calx*, lime), Ca; at. wt. 40.08; at. no. 20; m.p. 810° C; b.p. 1439 ± 5 (1170)° C; sp. gr. 1.54 (29°); valence 2. Discovered in 1808 by Davy, and by Berzelius and Pontin independently by preparation of an amalgam electrolytically and removal of the mercury by distillation. Calcium is a metallic element, fifth in abundance in the earth's crust, of which it forms 3.5%; an essential constituent in leaves, bones, teeth and shells. It is prepared by electrolysis of the fused chloride. Chemically it is one of the alkaline earth elements; it tarnishes readily in air, reacts with water, burns with a brilliant crimson flame to the oxide and forms many compounds of which the following are the most important: carbide (CaC_2),

carbonate in the various forms known as limestone, marble, *calcite*, *aragonite*, stalactites and stalagmites ($CaCO_3$), chloride ($CaCl_2$), cyanamide ($CaCN_2$), fluoride (CaF_2), hydroxide or slaked lime ($Ca(OH)_2$), hypochlorite or bleaching powder ($Ca(ClO)_2$ or $CaClOCl$), nitrate ($Ca(NO_3)_2$), oxide or quick lime (CaO), phosphate or *apatite* ($Ca_3(PO_4)_2$), sulfate or *gypsum* ($CaSO_4$), and sulfide (CaS).

Carbon (L. *carbo*, charcoal), C; at. wt. 12.00; at. no. 6; m.p. sublimes above 3500° C; b.p. 4200° C; sp. gr. amorphous 1.88, graphite 2.25, diamond 3.51; valence 2, 3 or 4. Carbon, an element of prehistoric discovery, is very widely distributed in nature, occurring free as diamond and graphite, and in an impure form as coal; in combination it occurs as carbon dioxide, carbonates and as a constituent of all living things. It occurs in three allotropic forms, the diamond, graphite, and amorphous, all forms being solids, insoluble in any common solvent but dissolving in melted metals from which they crystallize on cooling in the form of graphite; when the cooling takes place under pressure some of the carbon is obtained as diamond. Carbon is unique in forming an almost infinite number of compounds, there being at the present time half a million known compounds; the most common are the carbonates, carbon dioxide (CO_2); carbon monoxide (CO); carbon disulfide (CS_2); chloroform ($CHCl_3$); carbon tetrachloride (CCl_4); alcohol (C_2H_6O); acetic acid ($HC_2H_3O_2$) and oxalic acid ($H_2C_2O_4$).

Cerium (named after the planetoid *Ceres* which was discovered in 1801 only a short time before the element), Ce; at. wt. 140.13; at. no. 58; m.p. 640° C; b.p. 1400° C; sp. gr. 6.90 (20°); valence 3 or 4. Discovered in 1803 by Klaproth and by Berzelius and Hisinger. Metal prepared by Hillebrand and Norton in 1875. Cerium is found in a few rare minerals, *orthite*, *cerite*, and the *samarskite* of North Carolina. It is a steel-gray lustrous metal prepared by the electrolysis of the chloride. It is used as the oxide as an important constituent of incandescent gas mantles, and as a pyrophoric alloy with iron which gives off showers of sparks when struck.

Cesium (L. *caesius*, sky blue), Cs; at. wt. 132.91; at. no. 55; m.p. 28.5° C; b.p. 670° C; sp. gr. 1.87 (26°); valence 1. The first metal discovered by Bunsen and Kirchoff with the spectroscope. This was in 1860, the source being a mineral water from Durkheim. Cesium is an alkali metal occurring in *lepidolite*, *pollucite* and some mineral springs; it is isolated by electrolysis of the fused cyanide. Cesium is characterized by a spectrum containing two bright lines in the blue along with several others in the red, yellow and green. Because of its great affinity for oxygen the metal is used as a "getter" in radio tubes. It is also used as a catalyst in the hydrogenation of certain organic compounds. Its chief compounds are $CsCl$ and $CsNO_3$.

Chlorine (Gr. *chloros*, green), Cl; at. wt. 35.457; at. no. 17; m.p. −101.6° C; b.p. −34.6° C; density 3.214^0 g/l; sp. gr. 1.56 (−33.6°); valence 1, 3, 5 or 7. Discovered in 1774 by Scheele,

who thought it contained oxygen; named by Davy in 1810. In nature it is found in the combined state only, chiefly with sodium as common salt (NaCl), *carnallite* ($KMgCl_3.6H_2O$), and *sylvite* (KCl). A member of the halogen group of elements, it is obtained from chlorides by the action of oxidizing agents or by electrolysis; it is a greenish-yellow gas, with an irritating and suffocating odor, attacking the respiratory tract producing symptoms of pneumonia (war gas), combining directly with nearly all elements. At 10° C one volume of water dissolves 3.10 volumes of chlorine; at 30° C, 1.77 volumes of chlorine. The most important compounds are the chlorides, hypochlorites and chlorates. In 1933 the price was about 2¢ a pound as a liquid in tanks at the works where it is produced.

Chromium (Gr. *chroma*, color), Cr; at. wt. 52.01; at. no. 24; m.p. (1520) 1615° C; b.p. 2200° C; sp. gr. 7.1 (20°); valence 2, 3 or 6. Discovered in 1797 by Vauquelin, who prepared the metal the next year. Chromium is a metallic element resembling iron, occurring chiefly in chrome iron ore ($FeO.Cr_2O_3$) and is prepared by the reduction of the oxide with aluminum; it is a very infusible, hard gray metal used to harden steel. The most important compounds are the sodium and potassium chromates (K_2CrO_4), dichromates ($K_2Cr_2O_7$), and the potassium and ammonium chrome alums $CrK(SO_4)_2.12H_2O$. The metal is widely used in stainless steel and in chromium plating. The price of the ore in 1933 was $14 to $18 a ton.

Cobalt (G. *Kobold*, goblin or evil spirit), Co; at. wt. 58.94; at. no. 27; m.p. 1480° C; b.p. 2900° C; sp. gr. 8.9 (20°); valence 2 or 3. Discovered by Brandt in 1735. Cobalt is a metallic element occurring in ores which are sparingly distributed; most frequently in *smaltite* ($CoAs_3$), *linnaeite*, *wad* or *cobalt bloom* (Co_3S_4) and *cobalite* or *cobalt glance* (CoSAs). The metal is prepared by reducing the oxide with aluminum; it is brittle, hard, very magnetic, and of a gray color with a reddish tinge. It is used to alloy with other metals, and the salts are chiefly used for the production of brilliant and permanent blue colors in porcelain, glass, pottery, tiles, and enamels, being the principal ingredient in *Sevres blue* and *Thenard's blue*. The chief compounds are the oxide (CoO), the chloride ($CoCl_2.6H_2O$) and the nitrate ($Co(NO_3)_2.6H_2O$). The price of the metal in 1935 was about $2.50 a pound.

Columbium (*Columbia*, also called Niobium), Cb or Nb; at. wt. 92.91; at. no. 41; m.p. 1950° C; b.p. > 3300° C; sp. gr. 8.4; valence 3 or 5. Discovered in 1801 by Hatchett in an ore sent to England by John Winthrop, first governor of Connecticut, more than a century before; metal prepared by Blomstrand, who reduced the chloride by heating in hydrogen, in 1864. Columbium is a very rare metallic element, occurring chiefly in *niobite* or *columbite*; it is prepared by reducing the oxide with carbon in the electric furnace; it is a gray metal, forming an acid oxide, Cb_2O_5, from which the salts are derived. Balke in 1929 prepared extremely white and beautifully polished sheets and rods.

Copper (L. *Cyprium*, from the Island of Cyprus) Cu (cuprum); at. wt. 63.57; at. no. 29; m.p. 1083° C; b.p. 2310° C; sp. gr. 8.93–8.95; valence 1 or 2. The discovery of copper dates from prehistoric times; it is said to have been mined for more than 5000 years. Copper is a metallic element, reddish colored, bright, metallic luster, malleable, ductile, a good conductor of heat and electricity (second to silver in electrical conductivity) occurring native and in various ores: *chalcocite* (Cu_2S), *chalcopyrite* ($CuFeS_2$), *bornite* (Cu_3FeS_3), *covelite* (CuS), *malachite* ($CuCO_3.Cu(OH)_2$), *azurite* ($Cu_3(OH)_2(CO_3)_2$), *cuprite* (Cu_2O), *tenorite* (CuO), *chrysocolla* ($CuSiO_3.2H_2O$), *chalcanthite* ($CuSO_4.5H_2O$) and *tetrahedrite* ($4Cu_2S.Sb_2S_3$). It is obtained from ores by smelting, leaching or electrolysis. The most important compounds are the oxide (CuO) and the sulfate (blue vitriol, $CuSO_4.5H_2O$). The price of copper in 1917 was 35¢ a pound, and in 1935, 9¢ a pound.

Dysprosium (Gr. *dysprositos*, hard to speak with), Dy; at. wt. 162.46; at. no. 66; m.p. . . . .; b.p. . . . .; sp. gr. . . . .; valence 3. Discovered in 1886 by Lecoq de Boisbaudran. Dysprosium is a member of the erbium family of rare earths and occurs in the minerals *xenotime*, *fergusonite*, *gadolinite*, *euxonite*, *polycrase* and *blomstrandine*. The free element has never been isolated; it forms highly colored salts.

Erbium (Ytterby, a town in Sweden), Er; at. wt. 167.64; at. no. 68; m.p. . . . .; b.p. . . . .; sp. gr. 4.77(?); valence 3. Discovered in 1843 by Mosander. Erbium is a member of the family of rare earths which includes thulium, erbium, holmium and dysprosium in the order of increasing basicity. It forms highly colored salts and an oxide Er_2O_3. It occurs in the minerals *xenotime*, *fergusonite*, *gadolinite*, *euxonite*, *polycrase* and *blomstrandine*.

Europium (Europe), Eu; at. wt. 152.0; at. no. 63; m.p. . . . .; b.p. . . . .; sp. gr. . . . .; valence 2 or 3. *See Terbium.* Discovered in 1901 by Demarcay. Europium is the most sparsely distributed of the terbium family of rare earths which includes europium, gadolinium, and terbium in the order of decreasing basicity. Salts of the type EuX_3 and EuX_2, where X is a univalent atom or radical, are known. The general characteristics of this family resemble those of the cerium family.

Fluorine (L. *fluo*, flow), F; at. wt. 19.000; at. no. 9; m.p. −223° C; b.p. −187° C; density 1.69 g/l (15°); sp. gr. of liquid 1.11 (−187°); valence 1. Discovered by Scheele in 1771; isolated by Moissan in 1886. It occurs chiefly in *fluor spar* (CaF_2) and *cryolite* (Na_3AlF_6). Fluorine, a member of the halogen family of elements, is obtained by electrolyzing a solution of potassium hydrogen fluoride in anhydrous hydrogen fluoride; it is a pale yellow gas, uniting directly with silicon, carbon, hydrogen and nearly all other elements in the dark; decomposes almost all compounds to form fluorides, except in the case of oxygen, with which it forms no compounds. The most important compounds are hydrogen fluoride, which is

used in etching glass, and calcium fluoride. Both the element and hydrofluoric acid are dangerous poisons. The presence of fluorides in drinking water is the cause of mottled enamel in teeth.

Gadolinium (*Gadolin*, a Swedish chemist), Gd; at. wt. 157.3; at. no. 64; m.p. . . . . ; b.p. . . . . ; sp. gr. . . . . ; valence 3. Separated by Marignac in 1880 and by Lecoq de Boisbaudran in 1886. Gadolinium is a member of the terbium family of rare earths which includes terbium and europium. The general characteristics of this family resemble those of the cerium family; the free element has never been isolated; the element forms oxides of the type R_2O_3, and its salts are usually more soluble than the corresponding terbium salts. Gadolinium is the most plentiful of the three terbium family elements. These elements decrease in basicity in the order Eu, Gd and Tb.

Gallium (L. *Gallia*, France), Ga; at. wt. 69.72; at. no. 31; m.p. 29.75° C; b.p. 2000 ± 150° C; sp. gr. 5.91 (20°); valence 2 or 3. Discovered spectroscopically by Lecoq de Boisbaudran in 1875 in the zinc blend of Pierrefitte, Hautes-Pyrenees, although its occurrence was predicted before that time by Mendeleeff, who named it eka-aluminum. Gallium is a rare metal belonging to the aluminum group and is the only metal besides mercury, cesium and rubidium which can be a liquid at near room temperatures. This makes possible its use in high temperature thermometers. The solid is a hard, grayish-white substance. It forms two sets of chlorides, bromides, iodides, nitrates, sulfates and oxides in which it appears as divalent and trivalent. The price of gallium in 1932 was $2.50 a gram.

Germanium (L. *Germania*, Germany), Ge; at. wt. 72.60; at. no. 32; m.p. 958° C; b.p. volatilizes at 2700° C; sp. gr. 5.36 (20°); valence 4. Discovered by Winkler in 1886, although it was predicted before that time by Mendeleeff, who named it eka-silicon. It is prepared by reducing the oxide obtained from a silver ore (*argyrodite*) with carbon or with hydrogen. Germanium is a metallic element of the silicon group lying between silicon and tin in chemical properties; it is a gray-white, brittle, crystalline metal that retains its luster in air at room temperatures. The most important compounds are the oxide (GeO_2) and the halides ($GeCl_4$), the latter being volatile.

Glucinum, see *Beryllium.*

Gold (Anglo-Saxon *gold*), Au (L. *aurum*, shining dawn); at. wt. 197.2; at. no. 79; m.p. 1063° C; b.p. 2600° C; sp. gr. 19.32 (17.5°); valence 1 or 3. Valued highly from earliest times. Often occurs native or uncombined, principally in rock deposits or in alluvial deposits; obtained from its ores by cyanidation, amalgamation and smelting. It is a metallic element, having a yellow color when in mass, but when finely divided may be black, ruby or purple; it is the most malleable and ductile, and also one of the softest of the metals; it is a good conductor of heat and electricity and is not affected by air and most reagents. Its chief use is in coinage and jewelry; when used as a standard

of value by U. S., 1 Troy ounce was worth $20.67+. The commonest compounds are the auric chloride ($AuCl_3$) and the chloroauric acid ($HAuCl_4$), the latter used in photography for toning the silver image.

Hafnium (*Hafnia*, Copenhagen), Hf; at. wt. 178.6; at. no. 72; m.p. 2207 (1700?)° C; b.p. > 3200° C; sp. gr. 13.3; valence 4. Discovered in 1922 by D. Coster and G. von Hevesy in a *zircon* from Norway by means of Röntgen spectroscopic analysis. On the basis of the Bohr theory the new element, atomic number 72, was expected to be associated with zirconium. On treatment of the mineral with potassium bifluoride and separation of K_2ZrF_6, the mother liquors became richer in the new element. All the zirconium minerals investigated except *polymignite* (Zr-Ti) contained hafnium, most of them having it present to the extent of 5% of the zirconium content. It has been separated from zirconia by repeated recrystallization of the double ammonium or potassium fluorides. Metallic hafnium was prepared by van Arkel and de Boer by passing the vapor of the tetraiodide over a heated tungsten filament; it has the same crystalline structure as zirconium. Hafnium also resembles zirconium in chemical properties.

Helium (Gr. *helios*, the sun), He; at. wt. 4.002; at. no. 2; m.p. −272.2° C (26 atm.); b.p. −268.9° C; density 0.177 g/l; valence 0. Evidence of the existence of helium was first obtained by Sir Norman Lockyer during the eclipse of 1868 when he detected a new line in the solar spectrum; in 1895 Ramsay isolated helium from *uraninite*. Helium is a gas, inert chemically, obtained by compression and fractionation of the gas from certain wells and from the minerals *uraninite*, *cleveite*, *fergusonite*, *monazite*, *thorianite* and many radioactive minerals. H. K. Onnes has cooled the element to the lowest temperature ever obtained, −272.918° C; and expressed the opinion that helium may remain a liquid even at absolute zero under normal pressure. In June 1926, Keesom succeeded in producing solidification at −271.9° C under a pressure of 26 atmospheres. Although slightly heavier than hydrogen it is a valuable gas for inflating balloons because of its non-inflammability. The price of helium in 1920 was $104 per cu. ft., but by 1933 this had been reduced to $7.10 per 1000 cu. ft.

Holmium (L. *Holmia*, for Stockholm), Ho; at. wt. 163.5; at. no. 67; m.p. . . . .; b.p. . . . .; sp. gr. . . . .; valence 3. Discovered by Cleve while working on erbia earth in 1879; pure holmia earth was isolated by Holmberg in 1911. Holmium is a member of the erbium family of rare earths which includes thulium, erbium, holmium and dysprosium in the order of increasing basicity. It is obtained from *xenotime*, *fergusonite*, *gadolinite*, *euxenite*, *polycrase* and *blomstrandine*. The element forms highly colored salts; the free element has never been isolated.

Hydrogen (Gr. *hydro*, water, and *genes*, forming), H; at. wt. 1.0078; at. no. 1; m.p. −259° C; b.p. −252.8° C; density 0.0899 g/l; sp. gr. liquid 0.070 (−252° C); valence 1. First

recognised as a distinct substance in 1766 by Cavendish; named by Lavoisier. Hydrogen occurs chiefly in combination with oxygen as water; also in acids, bases and alcohols as well as in petroleum and other hydrocarbons. It is usually a constituent of organic compounds, especially those used as fuels and as food. It is the lightest of all gases, insoluble in water, uniting with many elements to form compounds; it is used as a reducing agent, as a means of obtaining high temperature flames, and for inflating balloons. It is prepared by the electrolysis of water, by displacement from acids with metals, or by the action of steam on heated carbon. Isotope-2 announced by Urey in 1932.

Illinium (University and State of Illinois), Il; at. wt. estimated 146; at. no. 61; m.p. ....; b.p. ....; sp. gr. ....; valence doubtless 3. The discovery of Illinium was announced in 1926 by Hopkins, Yntema and Harris, on the basis of absorption, arc, and X-ray emission spectra. Later in the same year Rolla and Fernandez in Italy claimed prior discovery and proposed the name "florentium." The late Charles James at the University of New Hampshire concentrated considerable illinium and other investigators have since confirmed the existence of the element. Illinium is a member of the cerium group of rare earths which includes lanthanum, cerium, praseodymium, neodymium, illinium and samarium, in the order of decreasing basicity. It occurs in exceedingly minute traces in *monazite*, *gadolinite*, and *xenotime*. Neither the metal nor its salts have been prepared pure.

Indium (From its indigo spectrum), In; at. wt. 114.76; at. no. 49; m.p. 155° C; b.p. > 1450° C; sp. gr. 7.28; valence 3. Discovered in 1863 by the use of the spectroscope by Reich and Richter, who later isolated the metal. Indium is a rare metallic element occurring in some zinc ores; it belongs to the aluminum group in properties, being a very soft, silvery metal, not acted on by water or air, burning to the sesquioxide (In_2O_3) with a blue-violet flame.

Iodine (Gr. *iodes*, violet), I; at. wt. 126.92; at. no. 53; m.p. 113.5° C; b.p. 183° C; density of gas 11.27 g/l, solid 4.93 (20°); valence 1, 3, 5 or 7. Discovered by Courtois in 1811. Iodine, a member of the halogen group of elements, occurs sparingly in the form of iodides in sea water from which it is assimilated by seaweeds, in Chile saltpeter, and in caliche (as sodium iodate); from iodides it is obtained on distillation with sulfuric acid and some oxidizing agent (MnO_2) and from the iodates by heating with sodium bisulfite. It is a grayish-black, lustrous solid, volatilizing at ordinary temperatures into a blue-violet gas with an irritating odor; it forms compounds with many elements but is less active than the other halogens, which displace it from iodides; it combines only partly with hydrogen when heated and has little or no action on hydrocarbons; it forms brown solutions with water (slightly soluble) and with alcohol or aqueous potassium iodide; with carbon disulfide, chloroform or carbon tetrachloride purple solutions are obtained. The most important compounds are the iodides of sodium and

potassium (KI) and the iodates (KIO_3). Its production from brines has lowered the price to about $2 a pound in 1933.

Iridium (L. *iris*, rainbow), Ir; at. wt. 193.1; at. no. 77; m.p. 2440 ± 15° C; b.p. 4400° C; sp. gr. 22.42 (17°); valence 3 or 4. Discovered in 1803 by Tennant. Iridium, a metallic element belonging to the platinum family, is a very hard, brittle, white metal, occurring in alluvial deposits along with platinum; it is used in apparatus for high temperatures; alloyed with platinum, it is used for standard weights and measures; alloys with osmium are used in tipping pens and compass bearings; iridium black, prepared by exposing alcoholic solutions of the sulfate to light, is used as a catalytic agent; the most important salt is the chloride ($IrCl_4$). The price in 1933 was about $160 an ounce.

Iron (Anglo-Saxon, *iron*), Fe (L., *ferrum*); at. wt. 55.84; at. no. 26; m.p. 1535° C; b.p. 3000° C; sp. gr. 7.85–7.88; valence 2 or 3. Iron articles are said to have been made by the Egyptians 3000 years B.C. Its most common ore is *hematite*, (Fe_2O_3) from which the metal is obtained by reduction with carbon. Iron is the most abundant of metals, though aluminum occurs in larger percentage in the earth's crust than iron. The pure metal, which is practically unknown in the Arts (although some grades of soft steel are almost chemically pure), is silver-white, very ductile and magnetic; the pure metal may be prepared by electrolytic deposition from ferrous sulfate or by reduction of pure oxide with hydrogen or aluminum; pig iron is hard, brittle and fairly fusible, containing about 3% carbon and varying amounts of sulfur, silicon, manganese and phosphorus; wrought iron is tough, grayish-white, and malleable, having usually a fibrous structure, very infusible, with only a few tenths per cent or less of carbon; steel is a solid solution of iron carbide in iron with a carbon content usually below 2%. Iron is the cheapest metal known, pig iron usually costing less than a cent a pound and steel about twice as much.

Krypton (Gr. *kryptos*, hidden), Kr; at. wt. 83.7 at. no. 36; m.p. −157° C; b.p. −152.9° C; density 3.708 g/l (0°); valence 0. Discovered in 1898 by Ramsay and Travers in the residue left after liquid air had nearly boiled away. Krypton is an inert, rare, gaseous element, occurring in small amounts in the atmosphere, and is characterized by a brilliant green and yellow line in its spectrum. The price of krypton in 1928 was about $7 per cm^3.

Lanthanum (Gr. *lanthano*, to conceal), La; at. wt. 138.92; at. no. 57; m.p. 885 ± 5° C; b.p. 1800° C; sp. gr. 6.155; valence 3. Discovered by Mosander in 1839. Lanthanum occurs in the ores *cerite*, *orthite*, and *monazite;* it is prepared from the chloride by treatment with sodium, or by electrolysis of a fused bath of $LaCl_3$, KCl and CaF_2. Lanthanum is a metallic element of the rare earths, resembling iron in its physical properties, burning brilliantly in air to form the oxide (La_2O_3).

Lead (Anglo-Saxon, *lead*), Pb (L., *plumbum*); at. wt. 207.22; at. no. 82; m.p. 327.5° C; b.p. 1620° C; sp. gr. 11.35; valence

2 or 4. Long known; mentioned in Exodus. Lead is obtained chiefly from *galena* (PbS) by a roasting process. It is a metallic element of bluish-white color and bright luster, very soft, highly malleable, has slight tenacity, is ductile and a poor conductor of electricity. It is used in making pipe and containers for corrosive liquids, and is a constituent of many useful alloys including solder, type metal and various antifriction metals. Important lead salts are the nitrate ($Pb(NO_3)_2$), sulfate ($PbSO_4$), acetate ($Pb(C_2H_3O_2)_2$), carbonate ($PbCO_3$), the basic carbonate or *White Lead* ($2PbCO_3.Pb(OH)_2$). Lead salts are used in medicine for washes and lotions because of the astringent properties of the solutions. The price of lead during the World War reached 11¢ a pound, dropping to about 3¢ in 1933.

Lithium (Gr. *lithos*, stone), Li; at. wt. 6.940; at. no. 3; m.p. 186° C; b.p. 1336° C; sp. gr. 0.534; valence 1. Discovered by Arfvedson in 1817. Lithium is widely distributed in combination with other elements occurring in the soil, waters and the minerals *lepidolite* and *spodumene* (silicates occurring in California and South Dakota respectively) *amblygonite* (phosphate); it is produced electrolytically. Lithium is a soft white metal, belonging to the alkali-metal group, the lightest metal known. When burned in air it forms the oxide lithia (Li_2O); it also forms a number of salts analogous to the salts of sodium or potassium. The carbonate and citrate are used in medicine to remove uric acid from the body, lithium urate being a soluble salt. The price in 1930 was about $20 a pound.

Lutecium (*Lutetia*, ancient name of Paris) Lu; at. wt. 175.0; at. no. 71; m.p. . . . . ; b.p. . . . . ; sp. gr. . . . . ; valence 3. In 1907 Urbain and in 1908 von Welsbach described a process by which Marignac's ytterbium (1879) could be separated into the two elements ytterbium (neoytterbium) and lutecium. Both elements occur in very small amounts in nearly all minerals containing yttrium. The best sources are probably *gadolinite*, *xenotime*, *polycrase* and *blomstrandine*. The oxide, chloride and sulfate have been prepared.

Magnesium (*Magnesia*, district in Thessaly), Mg; at. wt. 24.32; at. no. 12; m.p. 651° C; b.p. 1110° C; sp. gr. 1.74 (20°); valence 2. Recognized by Black in 1755; isolated by Davy in 1808; prepared in coherent form by Bussy in 1831. Magnesium occurs very widely distributed in combination as *magnesite* ($MgCO_3$), *dolomite* (Mg and Ca carbonates), Epsom salts ($MgSO_4.7H_2O$) and *kainite* ($KCl.MgSO_4.3H_2O$). It is obtained by electrolysis of the fused chloride. It is a light, white, and fairly tough metal; tarnishes slightly in air and when in the form of ribbon, wire or powder it ignites on heating, burning with a dazzling white heat. It is useful in flash-light photography, and for pyrotechnic purposes. It is often alloyed with copper and aluminum; the most important compounds are the oxide (MgO), the sulfate ($MgSO_4$), the chloride ($MgCl_2$) and the citrate ($Mg_3(C_6H_5O_7)_2$). The first metallic magnesium

produced commercially in the U. S. brought \$10 a pound, but the price with the large production in 1933 was 30¢ a pound.

Manganese (L. *magnes*, magnet), Mn; at. wt. 54.93; at. no. 25; m.p. 1260° C; b.p. 1900° C; sp. gr. 7.2; valence 2. 4, 6 or 7. Discovered in 1774 by Gahn. Manganese ores are *pyrolusite* (MnO_2) and *psilomelane* ($RO.4MnO_2$, where R is Ba, Li, K or Mn); other ores found in smaller amounts are *braunite* ($3Mn_2O_3.MnSiO_3$) and *manganite* ($Mn_2O_3.H_2O$). The metal is obtained by reduction of the oxide with sodium, magnesium, aluminum or by electrolysis. It is a gray-white metal resembling iron, but harder and very brittle. It is used in the production of alloys with iron (spiegeleisen), copper, brass and nickel. The most important compounds are the chloride ($MnCl_2$), sulfate ($MnSO_4$), oxide (MnO), dioxide (MnO_2), and potassium permanganate ($KMnO_4$).

Masurium (Masurian province, once belonging to Germany), Ma; at. wt. ....; at. no. 43; m.p. 2300° C; b.p. ....; sp. gr. ....; valence .... Masurium is one of the eka-manganeses discovered by Noddack, Tacke (now Frau Noddack) and Berg in 1925 and occurs in the minerals *columbite*, *sperrylite*, *gadolinite* and *fergusonite*. The element was detected with the aid of the Röntgen spectrum and the relative occurrence in the earth's crust is estimated at 10^{-13}.

Mercury (Planet *Mercury*), Hg (hydrargyrum); at. wt. 200.61; at. no. 80; m.p. −38.87° C; b.p. 356.9° C; sp. gr. 13.595 (4°); valence 1 or 2. Known to ancient Chinese and Hindus; found in Egyptian tombs of 1500 B.C. Mercury or quicksilver occurs free in nature to a limited extent, but the chief source is the sulfide (*cinnabar*, HgS) from which it is obtained by heating in a current of air. It is a heavy, silver-white, shining metal, liquid, a fair conductor of heat and electricity, having a regular coefficient of expansion; it tarnishes but slightly in air except when heated to near the boiling point, where it is slowly converted to the oxide (HgO) from which the oxygen is again set free at higher temperatures. The most important salts are mercuric chloride (corrosive sublimate, $HgCl_2$), mercurous chloride (calomel, HgCl), and mercuric sulfide (vermilion, HgS). Mercury dissolves many metals forming *amalgams* with them. The price of mercury, usually as much as \$1 a pound, was as low as 71¢ in 1933.

Molybdenum (Gr. *molybdos*, lead), Mo; at. wt. 96.0; at. no. 42; m.p. 2620° C; b.p. 3700° C; sp. gr. 10.2; valence 3, 4 or 6. Discovered in 1782 by Hjelm. Molybdenum does not occur native, being obtained from *molybdenite* (MoS_2) and from *wulfenite* ($PbMoO_4$). The metal is prepared by reduction of the oxide with carbon in the electric furnace. It is a very hard, silver-white metal; it is used chiefly in the manufacture of certain grades of tool steel, boiler plate, rifle barrels, and large cranks, as well as in making filaments, screens and grids for radios.

Neodymium (Gr. *neos*, new and *didymos*, twin), Nd; at. wt. 144.27; at. no. 60; m.p. 840° C; b.p. ....; sp. gr. 6.95;

valence 3. In 1843 Mosander reported the supposed element didymium obtained from *cerite.* In 1885 von Welsbach separated didymium into two new elements, neodymium and praseodymium by repeated fractionation of ammonium didymium nitrate. Neodymium is a metallic element, belonging to the rare earths, forming a series of pink salts with a characteristic absorption spectrum.

Neon (Gr. *neos,* new), Ne; at. wt. 20.183; at. no. 10; m.p. −248.67° C; b.p. −245.9° C; density 0.9002 g/l (0°); valence 0. Discovered by Ramsay and Travers in 1898. Neon is a gaseous element present in the atmosphere to the extent of one or two parts per 100,000. It is obtained by liquefaction of air and separated from the other elements by fractional distillation. It is an inert element forming no compounds. Neon glows red-orange in a vacuum tube and is marked by pronounced red and green lines in its spectrum. The price of neon in 1928 was about $10 per liter.

Nickel (Sw. abbr. of *kupparnickel*), Ni; at. wt. 58.69; at. no. 28; m.p. 1452° C; b.p. 2900° C; sp. gr. 8.90; valence 2 or 3. Discovered by Cronstedt in 1751. Nickel is obtained chiefly from the nickeliferous *pyrrhotite* of Ontario and the *garnierite* (hydrated silicate of nickel, iron and magnesia found in New Caledonia) by roasting to the oxide, which is then reduced by carbon or carbon monoxide. It is a hard, malleable, ductile and tenacious metal, of a white color, somewhat magnetic, a fair conductor of heat and electricity; it belongs to the iron-cobalt group of elements. It is chiefly valuable for the alloys which it forms with other metals—nickel steel, German silver (brass and 15–20% Ni), coinage with 75% copper, and Monel metal ($2\frac{1}{2}$ parts Ni and 1 part copper); electrodeposition of nickel plate is used as a protective coating for metals. The most important compounds are the sulfate ($NiSO_4$), and the oxides (NiO and Ni_2O_3). The price of the metal in 1935 was 35¢ a pound.

Niobium, see *Columbium.*

Nitrogen (L. niter forming), N; at. wt. 14.008; at. no. 7; m.p. −209.9° C; b.p. −195.8° C; density 1.2506 g/l; sp. gr. liquid 0.808 (−195.8° C), solid 1.026 (−252° C); valence 3 or 5. Discovered by Daniel Rutherford in 1772. Nitrogen is a gaseous element which occurs free in the atmosphere, of which it forms about four-fifths, and from which it can be obtained by liquefaction and fractional distillation. It is easily obtained by heating a water solution of ammonium nitrite (mixture of ammonium chloride and sodium nitrite). It is a colorless, odorless and relatively inert element, combining directly with magnesium, lithium and calcium when heated with them. When mixed with oxygen and subjected to electric sparks it forms nitrogen peroxide. It occurs in all living things as an essential ingredient and also occurs in the deposits of saltpeter (sodium and potassium nitrate). The chief compounds are the nitrates of many metals, the five oxides (N_2O, NO, N_2O_3, NO_2 and N_2O_5) and ammonia (NH_3).

Osmium (Gr. *osme*, odor), Os; at. wt. 191.5; at. no. 76; m.p. 2700° C; b.p. 4450° C; sp. gr. 22.48; valence 2, 3, 4 or 8. Discovered in 1803 by Tennant. Osmium occurs in *iridosmine* and in platinum bearing river sands of the Urals, North America and South America. It is a bluish-white, hard, crystalline metal belonging to the platinum family of elements. It is the heaviest known form of matter, is very infusible, oxidizing when heated in the air to the oxide (OsO_4) with a pungent, irritating and poisonous vapor, which is easily reduced by organic matter. Osmium was used in making lamp filaments, and with iridium forms the alloy osmiridium which is used because of its hardness in tipping gold pens and for fine machine bearings. The price in 1928 was about $78 per ounce.

Oxygen (Gr. acid former) O; at. wt. 16.000; at. no. 8; m.p. −218.4° C; b.p. −183.0° C; density 1.429 g/l (0°); sp. gr. liquid 1.14 (−183° C); valence 2. Discovered in 1774 by Priestley, who obtained it by heating mercuric oxide, using the sun's rays with a burning glass. Oxygen is a gaseous element which occurs free in the atmosphere, of which it forms about one-fifth and from which it can be obtained by liquefaction and fractional distillation; it is also prepared by heating barium peroxide (BaO_2), heating potassium chlorate ($KClO_3$), by electrolysis of water containing a small amount of sulfuric acid, and by adding sodium peroxide (Na_2O_2) to water. The critical temperature and pressure are −118° C and 50 atmospheres. Gaseous oxygen is colorless, odorless and tasteless; the liquid and solid forms are a pale blue color and are magnetic, but much less so than iron. Oxygen is very reactive, capable of combining with all elements except the inert elements of the atmosphere and bromine and fluorine. Under suitable conditions it may be converted into an allotropic form known as ozone (O_3). It is used in combination with combustible gases in the oxygen blow pipes and flames; in medicine it is used to aid respiration.

Palladium (Planet *Pallas*), Pd; at. wt. 106.7; at. no. 46; m.p. 1555° C; b.p. 2200° C; sp. gr. 11.40 (22.5°); valence 2 or 4. Discovered in 1803 by Wollaston. Palladium is obtained in working up platinum, with which it occurs native. It is a steel-white metal, belonging to the platinum family of elements. It does not tarnish in air and has the property of absorbing large volumes of hydrogen to form the hydride (Pd_2H). It is used in the construction of non-magnetic watches and parts of delicate balances. The most important compound is the chloride, ($PdCl_2$). The price of the metal in 1931 was about $18 an ounce.

Phosphorus (Gr. *light bearing*) P; at. wt. 31.02; at. no. 15; m.p. 44.1° C; b.p. 280° C; sp. gr. yellow 1.82, red 2.20; valence 3 or 5. Discovered in 1669 by Brand, who prepared it from urine. Phosphorus occurs in three allotropic forms—*viz.*, yellow, red and black. Though never found free in nature, it is widely distributed in combination in minerals, the most important being the *apatites* ($3Ca_3(PO_4)_2CaF_2$ and $3Ca_3(PO_4)_2.CaCl_2$)

which are the chief ingredients of commercial phosphates derived from South Carolina, Canada and Spain; it is an essential ingredient of all cell protoplasm, nervous tissue and bones. It is obtained from phosphates by treatment with dilute sulfuric acid to form o-phosphoric acid, the concentrated solution of which is mixed with crushed charcoal or coke and dried; on heating this mixture in retorts, the phosphorus distils and is condensed. It is also prepared by heating crude phosphate with sand and coke in the electric furnace, the phosphorus distilling off. Ordinary phosphorus is a waxy solid which is colorless when very pure, insoluble in water and soluble in carbon disulfide; it takes fire spontaneously in air, burning to the pentoxide; it is very poisonous; when heated in its own vapor to 250° C it is converted into the red variety which does not glow in air and which does not ignite spontaneously and is not poisonous. The most important compounds are the pentoxide or phosphoric anhydride (P_2O_5), the chlorides (PCl_3 and PCl_5) and the phosphates of the alkali metals. The prices of the red and yellow varieties in 1933 were about 44¢ and 32¢ a pound respectively.

Platinum (Sp. *platina*, little silver) Pt; at. wt. 195.23; at. no. 78; m.p. 1755° C; b.p. 4050° C; sp. gr. 21.45; valence 2 or 4. Discovered in South America by Ulloa in 1735 and by Wood in 1744. Platinum occurs native in alluvial deposits or in rock forming minerals found principally in the Ural mountains, in Colombia, in California, Oregon, Arizona and Alaska. It is a tin-white metal of metallic luster, tenacious, malleable and ductile. It is welded at a red heat, has a coefficient of linear expansion approximately equal to that of glass; does not oxidize in air at any temperature but is corroded by halogens, cyanide, sulfur and caustic alkalies; it forms alloys with lead; it has a catalytic effect of bringing about combinations such as sulfur dioxide and oxygen. The most important compound is chloroplatinic acid (H_2PtCl_6). The price of platinum has varied widely, being nearly eight times as valuable as gold in 1920 and approaching the price of gold ($20.67 an ounce) in 1933.

Polonium (Poland, native country of Mme. Curie). Po; at. wt. approximately 210; at. no. 84. First element discovered by Marie Curie (1898) in seeking cause of radioactivity of pitchblende from Joachimisthal, Bohemia. The electroscope, claimed to be 500,000 times more sensitive than the spectroscope, showed it separating with the bismuth. Polonium is also called Radium F. (See Radioactive Elements.)

Potassium (Eng. *potash*), K (*kalium*); at. wt. 39.096; at. no. 19; m.p. 62.3° C; b.p. 760° C; sp. gr. 0.86; valence 1. Discovered in 1807 by Davy; the first metal to be isolated from an earth by the electric current. The principal sources of potassium are: the mines of Stassfurt in Prussian Saxony from the minerals *kainite* ($MgSO_4.KCl.3H_2O$), *sylvin* (KCl), and *carnallite* ($KCl.MgCl_2.6H_2O$); crude potassium carbonate or potash obtained by extraction of wood ashes; potassium salts

from natural brines, from cement mill and blast furnace dust, from kelp, from Searles Lake, California. Potassium is never found free but is obtained by electrolysis of the hydroxide (KOH). On exposure to moist air it becomes coated with a film of the oxide, and is preserved by immersion in kerosene or naphtha. It is a soft, bright silvery metal belonging to the alkali group. The chief compounds are the hydroxide, the carbonate (K_2CO_3), nitrate (KNO_3), chloride (KCl), chlorate ($KClO_3$), bromide (KBr), iodide (KI), cyanide (KCN), sulfate (K_2SO_4), dichromate ($K_2Cr_2O_7$), chromate (K_2CrO_4) and silicate (K_2SiO_3).

Praseodymium (Gr. *praesos*, green, and *didymos*, twin), Pr; at. wt. 140.92; at. no. 59; m.p. 940° C; b.p. ....; sp. gr. 6.5 (20°); valence 3. Discovered in 1885 by von Welsbach, who separated it and neodymium from didymium, which had been obtained from *cerite*. Praseodymium is a metallic element belonging to the group of rare earths. It forms green salts with a characteristic absorption spectrum.

Protoactinium (Gr. *protos*, first), Pa; at. wt. ....; at. no. 91. The first element of the actinium series of radioactive elements was discovered by Soddy and Cranston and independently by Hahn and Meitner, both in 1917. It has been called the "mother substance" or the "parent" of actinium, which it forms by the loss of an alpha particle, and the "patriarch" of the series; known also as ekatantalum and uranium X_2. (See Radioactive Elements.)

Radium (L. *radius*, ray) Ra; at. wt. 225.97; at. no. 88; m.p. 960° C; b.p. 1140° C; sp. gr. 5 (?); valence 2. Obtained in 1911 by Mme. Curie and Debierne by the electrolysis of a pure solution of radium chloride, employing a mercury cathode; the amalgam on distillation in an atmosphere of hydrogen yielded the pure metal. In the form of a salt it was first isolated by M. and Mme. Curie in 1898 from the *pitchblende* in North Bohemia, in which it occurs in about one part in three million. The *carnotite* sands of Colorado yield about 2% uranium nitrate; the amount of radium in uranium is one part in 3,200,000. Richer ores have been found in the Belgian Congo and in the Great Bear Lake region of Canada. Radium is obtained commercially as the bromide or chloride. The metal, which is a brilliant white, alters very rapidly in contact with air, decomposes water and is somewhat more volatile than barium. The primary uses are in producing self-luminous paints and in the treatment of cancer and certain types of skin affections. One gram of radium produces about 0.1 cubic millimeter of emanation per day; this is pumped from the radium and sealed in minute tubes, which are then applied to the diseased parts. Radium loses about 1% of its activity in 25 years, being transformed into elements of lower atomic weight. (See Radioactive Elements.)

Radon (niton), Rn; at. wt. 222; at. no. 86; valence 0; m.p. −71° C; b.p. −61.8° C; density 9.73 g/l. Discovered in 1900 by Dorn and called radium emanation; isolated in 1908

by Ramsay and Gray, who named it niton, from the Latin word *nitens*, shining. They determined its density, finding it to be the heaviest gas known. It occupies the last place in the zero group of gases in the Periodic Table. Since 1923 it has been called radon to show its origin from radium. Thoron and actinon are isotopes. (See Radioactive Elements.)

Rhenium (Rhine, province once belonging to Germany), Re; at. wt. 186.31; at. no. 75; m.p. 3440° C; b.p. . . . .; sp. gr. 20.53; valence . . . .; Rhenium or dwimanganese is one of the eka manganeses discovered in 1925 by Noddack, Tacke and Berg in the minerals *columbite*, *tantalite* and *wolframite*. The metal can be hot forged or rolled; dissolves readily in HNO_3, slowly in H_2SO_4, and hardly at all in HCl. The element was detected with the aid of the Röntgen spectrum and the relative occurrence in the earth's crust is estimated at 10^{-9}. Its arc spectrum has been carefully studied by Meggers. The price of $10,000 per gram in 1928 dropped to $3 in 1930, the production increasing a thousand fold.

Rhodium (Gr. *rhodon*, rose), Rh; at. wt. 102.91; at. no. 45; m.p. 1985 ± 15° C; b.p. > 2500° C; sp. gr. 12.5; valence 3. Discovered in 1803 by Wollaston. Rhodium is a silver-white metallic element belonging to the platinum family, occurring native with other members of this group in river sands in the Urals and in North and South America. The salts form red solutions. An alloy with platinum is used in connection with pure platinum to make thermojunctions in some forms of pyrometers. The price in 1931 was about $50 an ounce.

Rubidium (L. *rubidus*, red), Rb; at. wt. 85.44; at. no. 37; m.p. 38.5° C; b.p. 700° C; sp. gr. 1.53; valence 1. Discovered by the use of the spectroscope in *lepidolite* by Bunsen and Kirchoff in 1861. Rubidium occurs in small quantities in the mineral waters of Dürkheim in Rhenish Palatinate, in *lepidolite* and in the rare minerals *castor* and *pollux* found in Elba. It is prepared by the electrolysis of the cyanide. Rubidium is a soft, white, rare metallic element of the potassium group; it forms salts similar to those of potassium and colors the flame red when held in a burner.

Ruthenium (*Ruthenia*, Russia), Ru; at. wt. 101.7; at. no. 44; m.p. 2450° C; b.p. 4150° C; sp. gr. 12.2; valence 3, 4, 6 or 8. Discovered in 1844 by Claus, more than a century after the discovery of the other metals of the platinum family. Ruthenium, belonging to the platinum group, occurs native with the other metals of this group. It is a hard, brittle, gray metal; it forms red or brown salts; ruthenious chloride ($RuCl_3$) gives a characteristic fine black precipitate with water. The price in 1931 was about $52 per ounce.

Samarium (*Samarski*, a Russian), Sm; at. wt. 150.43; at. no. 62; m.p. 1300–1400° C; b.p. . . . .; sp. gr. 7.7–7.8; valence 3. Discovered in 1879 by Lecoq de Boisbaudran in the mineral *samarskite*, named in honor of a Russian mine official. Samarium is a metallic element belonging to the rare earth

group, occurring in very minute quantities in *samarskite, cerite* and certain Scandinavian minerals.

Scandium (*Scandinavia*), Sc; at. wt. 45.10; at. no. 21; m.p. 1200° C; b.p. 2400° C; sp. gr. 2.5 (?); valence 3. Discovered by Nilson in 1879. Scandium is a metal belonging to the rare earth group which has not been isolated in the elementary form; it forms colorless salts derived from the oxide Sc_2O_3.

Selenium (Gr. *selene*, moon), Se; at. wt. 78.96; at. no. 34; m.p. 217° C; b.p. 688° C; sp. gr. 4.47–4.80, amorphous 4.27; valence 2, 4 or 6. Discovered in 1817 by Berzelius. The principal source of selenium is the flue dust obtained in burning pyrites in the manufacture of sulfuric acid. It is prepared in a red amorphous form by reduction of selenic acid, and this on melting and keeping somewhat below the melting point becomes crystalline. It is a gray, crystalline, semi-metallic appearing element of the sulfur group. Its conductivity for electricity increases with the brightness of the light with which it is illuminated. The compounds of selenium resemble those of sulfur very closely. Its chief use is in the glass and ceramics industries.

Silicon (L. *silex*, flint), Si; at. wt. 28.06; at. no. 14; m.p. 1420° C; b.p. 2600° C; sp. gr. 2.42; valence 4. First prepared by Berzelius in 1823. Silicon is not found free but in combination, is probably more widely distributed in the solid matter of the earth than any other element except oxygen. It occurs chiefly as the oxide, silica (SiO_2) (quartz, rock crystal, amethyst, agate, flint, jasper, opal, etc.) both free and in combination with the metallic oxides as silicates (granite, hornblende, asbestos, feldspar, clay, mica, etc.). It is obtained as an amorphous, brown powder on fusion of potassium fluosilicate with sodium or potassium; the crystalline form is obtained by passing silicon tetrachloride over melted aluminum in an atmosphere of hydrogen, or by heating potassium fluosilicate with zinc and sodium at a temperature just below the boiling point of zinc. Silicon is a non-metallic element resembling graphite in appearance; it is not attacked by acids with the exception of a mixture of nitric and hydrofluoric acids; it is soluble in hot caustic potash or soda, evolving hydrogen and forming the corresponding silicate (K_2SiO_3 or Na_2SiO_3). Glass, cement and clay working are called silicate industries.

Silver (Anglo-Saxon, *soelfor*), Ag (L. *argentum*); at. wt. 107.880; at. no. 47; m.p. 960.5° C; b.p. 1950° C; sp. gr. 10.50; valence 1. Known to ancients. Silver occurs native and in many ores, the chief ones being *argentite* (Ag_2S), *stephanite* (Ag_5SbS_4), *pyragyrite* (Ag_3SbS_3) and horn silver ($AgCl$); lead and copper ores yield considerable silver. It is obtained from the ores by smelting with lead or copper or by amalgamation with mercury. Silver is a pure white metal having a brilliant luster, a little harder than gold and excelled only by that metal in malleability and ductility; it excels all other metals as a

conductor of heat and electricity; it undergoes no change in water or pure air, but absorbs 22 times its volume of oxygen when melted, which is again expelled on cooling; it tarnishes in the vapors of sulfur compounds forming the sulfide (Ag_2S). The most important compounds of silver are the nitrate ($AgNO_3$) or lunar caustic, the oxide (Ag_2O), and the halides ($AgCl$, $AgBr$) which darken on exposure to light, an action of which use is made in photography. The price, which was $1.35 an ounce in 1920, dropped as low as 28¢ in 1933.

Sodium (English, *soda*), Na (L. *natrium*); at. wt. 22.997; at. no. 11; m.p. 97.5° C; b.p. 880° C; sp. gr. 0.971; valence 1. First isolated by Davy in 1807 by electrolysis. Sodium is very widely distributed in combination chiefly as common salt or sodium chloride; it is never found free, but is obtained by electrolysis of the hydroxide. It is a soft, bright silvery metal belonging to the alkali group. On exposure to moist air it becomes coated with a film of the oxide and is preserved by immersing in kerosene or naphtha. It decomposes water with the formation of hydrogen and the hydroxide of sodium; it burns in air with the formation of the peroxide (Na_2O_2); formerly it was used as a reducing agent in the preparation of metals (aluminum and magnesium); it is still used for the reduction of organic compounds, in the preparation of the peroxide and cyanide, and for keeping the mercury clean and active in gold extraction. The chief compounds are the chloride ($NaCl$), bromide ($NaBr$), iodide (NaI), carbonate (Na_2CO_3), bicarbonate ($NaHCO_3$), sulfate (Glauber's salt, $Na_2SO_4.10H_2O$), nitrate (saltpeter, $NaNO_3$), nitrite ($NaNO_2$), sulfite ($Na_2SO_3.7H_2O$), thiosulfate (hypo, $Na_2S_2O_3.5H_2O$) borate (borax, $Na_2B_4O_7.10H_2O$) and hydroxide ($NaOH$).

Strontium (*Strontian*, town in Scotland), Sr; at. wt. 87.63; at. no. 38; m.p. 752 (800)° C; b.p. 1150° C; sp. gr. 2.6; valence 2. Discovered by Crawford, a Scotchman, in 1790; metal isolated by Davy by electrolysis in 1808. Strontium is found chiefly in *celestite* ($SrSO_4$) and *strontianite* ($SrCO_3$). It is prepared by electrolysis of the fused chloride and resembles metallic calcium in its properties; it is a hard, yellowish metal. The salts are generally soluble in water with the exception of the sulfate, phosphate and carbonate; they impart a brilliant crimson color to the flame, and are used in pyrotechny for red fire. The most important salts are the bromide ($SrBr_2$), iodide (SrI_2) and carbonate ($SrCO_3$).

Sulfur (L. *sulfur*), S; at. wt. 32.06; at. no. 16; m.p. rhombic 112.8° C, monoclinic 119.0° C; b.p. 444.6° C; sp. gr. rhombic 2.07; monoclinic 1.957; valence 2, 4 or 6. Known to ancients. Sulfur occurs widely distributed in nature in the free form, Texas being the largest producer. In combination it occurs mostly as *pyrites;* sulfides of iron (FeS_2), copper and arsenic pyrites; sulfide of lead (*galena*), zinc (*blende*), mercury (*cinnabar*) and antimony (*stibnite*); it is also widely distributed in the form of the sulfates of calcium (*gypsum*), strontium (*celestite*), magnesium (*Epsom salt*) and barium (*heavy spar*). Sulfur is

a pale yellow, odorless, brittle solid, which is insoluble in water and soluble in carbon disulfide. It occurs in two crystalline forms and an allotropic form known as plastic sulfur which is insoluble in carbon disulfide and which reverts to the crystalline form on standing; a finely divided form known as flowers of sulfur is obtained by sublimation. It readily forms compounds known as sulfides with many elements. Sulfur is chiefly employed as a component of gunpowder and as a parasiticide. It is easily ignited in air, burning to form the dioxide, which is used in fumigation and in the manufacture of sulfuric acid; sulfur is a good electrical insulating material. The price of sulfur in 1933 was about $18 a ton at the mines.

Tantalum (Gr. *Tantalus*, mythological character) Ta; at. wt. 181.4; at. no. 73; m.p. 2850° C; b.p. >4100° C; sp. gr. 16.6; valence 5. Discovered in 1802 by Ekeberg. Tantalum occurs principally in the mineral *tantalite* ($FeTa_2O_6$) and is prepared by reduction of potassium fluotantalate (K_2TaF_7) with hydrogen followed by fusion in a vacuum. It can be drawn into a wire with a very high point of fusion and great tenacity which has been used in the construction of filaments for incandescent electric lamps. It is also used to alloy with other metals. It is soluble in fused alkalies, insoluble in acids. it forms the oxide Ta_2O_5. The price in 1931 was $91 a kilogram;

Tellurium (L. *tellus*, earth), Te; at. wt. 127.61; at. no. 52; m.p. 452° C; b.p. 1390° C; sp. gr. 6.24; valence 2, 4 or 6. Discovered by Müller von Reichenstein in 1782; named by Klaproth in 1798. Tellurium occurs as gold telluride and with some copper ores. It is obtained by reduction of telluric oxide and forms a powder of grayish white metallic appearance. It is a semi-metallic element of the sulfur group and forms tellurides with hydrogen and metals similar to the sulfides; the compounds H_2TeO_3 and H_2TeO_4 are only slightly acidic. The inhalation of the vapors of tellurium produces the very offensive "tellurium breath." Tellurium is used in ceramics.

Terbium (Ytterby, town in Sweden), Tb; at. wt. 159.2; at. no. 65; m.p. . . . . ; b.p. . . . . ; sp. gr. . . . . ; valence 3. Discovered by Mosander in 1843. Terbium occurs in *gadolinite* and in the majority of ceria and ytteria minerals. The terbium family of rare earths includes europium, gadolinium and terbium. None of the metals of the terbium family has been isolated. The general characters of this family resemble those of the cerium family. Among the rare earths the decrease in basicity is in the order Sa, Eu, Gd, Tb, Dy. The elements are all trivalent and yield colorless oxides of the type R_2O_3, although terbium alone furnishes the higher oxide Tb_4O_7. The salts of terbium are generally less soluble than those of gadolinium. These salts are of the type RX_3, where X is a univalent atom or radical. Europium also forms salts of the type EuX_2. Europium is most sparsely distributed and gadolinium the most plentiful of these elements.

Thallium (Gr. *thallos*, budding twig), Tl; at. wt. 204.39; at. no. 81; m.p. 303.5° C; b.p. 1650° C; sp. gr. 11.85; valence 1

or 3. Discovered in 1861 by Crookes, who isolated the metal in 1862. Lamy also isolated the metal in 1862. Thallium occurs in *pyrites* and is prepared from the flue dust of sulfuric acid works. The metal is obtained by heating thallium iodide with metallic sodium; it resembles lead, having a hardness of 1.2 compared with 1.5 for lead; the malleability is high and the tenacity is low; it exists in two allotropic forms with a transition temperature of 226° C; it is a poor conductor of electricity, tarnishes in air forming the oxide Tl_2O or the hydroxide TlOH in the presence of water; the element is displaced from solutions of its salts by zinc. Thallium salts are poisonous, and are used in the control of rodents such as squirrels. The price of thallium for 1931 was about $14 a pound.

Thorium (*Thor*, Scandinavian god of war), Th; at. wt. 232.12; at. no. 90; m.p. 1845° C; b.p. $>$3000° C; sp. gr. 11.2; valence 4. Discovered by Berzelius in 1828. Thorium occurs chiefly in *thorite* and other rare minerals. In the U. S. it is obtained chiefly from *monazite* which contains from 3 to 9 per cent of the oxide. The free element has been obtained by heating the double chloride or fluoride of thorium and potassium with metallic sodium or potassium. The element belongs to the tin group of metals. It burns brightly in oxygen to form the oxide ThO_2, which is also obtained on heating the nitrate, a reaction of which use is made in the preparation of incandescent gas mantles. Thorium emits radiations similar to but not identical with those of radium. (See Radioactive Elements.)

Thulium (*Thule*, Northland), Tm; at. wt. 169.4; at. no. 69; m.p. . . . .; b.p. . . . .; sp. gr. . . . .; valence 3. Discovered in 1879 by Cleve; pure thulia was isolated in 1911 by James. Thulium belongs to the erbium family of the rare earths which includes dysprosium, holmium, erbium, and thulium. They are obtained from *xenotime*, *fergusonite*, *gadolinite*, *euxonite*, *polycrase* and *blomstrandine*. They are characterized by their absorption spectra and the formation of highly colored salts; they form basic oxides of the type M_2O_3 with the following order of increasing basicity: thulium, erbium, holmium and dysprosium. The free elements have not been isolated.

Tin (Anglo-Saxon, *tin*), Sn (L, *stannum*); at. wt. 118.70; at. no. 50; m.p. 231.9° C; b.p. 2270° C; sp. gr. gray 5.75 (20°), rhombic 6.55, tetragonal 7.31 (20°); valence 2 or 4. Known to the ancients. Tin is found chiefly in the mineral *cassiterite* (SnO_2) and is obtained by roasting to remove sulfur and arsenic and smelting with powdered anthracite in a reverberatory furnace. It is a silver white, malleable and somewhat ductile metal with a low tenacity and highly crystalline structure; it takes a high polish and is used to coat other metals to prevent corrosion, as it does not corrode easily in air. When heated in air it forms the dioxide (SnO_2) which is feebly acid, forming stannate salts with basic oxides. The most important salt is the chloride ($SnCl_2.2H_2O$) which is used as a reducing agent

and as a mordant in calico-printing. Tin is obtained chiefly from the Malay states, Bolivia, Banka, Billiton, Cornwall and Australia. The price of the metal was above 70¢ a pound in 1919 and in 1927, but below 20¢ in 1932. It was rising in 1933.

Titanium (L. *Titans*, sons of the earth), Ti; at. wt. 47.90; at. no. 22; m.p. 1800° C; b.p. >3000° C; sp. gr. 4.5; valence 3 or 4. Discovered by Gregor in 1791; named by Klaproth in 1795; pure metal prepared by Hunter in 1910. Titanium occurs naturally as the oxide (TiO_2) as *rutile*, *brookite* and *anastase;* it occurs also in various titanates, and with many iron ores. The free element is prepared by heating the oxide with aluminum or by electrolysis of the solution of the oxide in calcium chloride. It is a lustrous white metal of the tin group; it burns in air, and is the only element which burns in nitrogen. The most important compounds are the oxide (TiO_2) which is feebly acidic and from which the titanates are derived; the halides (TiX_4), some are volatile; the nitrides (Ti_2N_2, Ti_3N_4), metallic in appearance. The metal is used with steel to increase the tensile strength; most of the metallurgical titanium of the U. S. comes from the *rutile* of Virginia. The oxide is used in high-grade white pigments. The price of titanium oxide in 1933 was less than 20¢ a pound.

Tungsten (Sw., heavy stone), W (G. *Wolfram*); at. wt. 184.0; at. no. 74; m.p. 3370° C; b.p. 4727° C; sp. gr. 19.3; valence 6. Discovered by d'Elhujar brothers in 1783. Tungsten occurs in the form of the oxide (WO_3) in *wolframite*, *hubnerite*, *scheelite*. The metal is obtained by reduction of the oxide with hydrogen, carbon, or aluminum. It is hard, brittle, nonmagnetic and forms the oxide when heated in air. The only solvent for tungsten is a mixture of nitric and hydrofluoric acids. It forms alloys with iron and manganese and imparts hardness to steel. It is used in filaments for incandescent lamps. The price of tungsten powder in 1933 was about $1.50 a pound.

Uranium (Planet *Uranus*), U; at. wt. 238.14; at. no. 92; m.p. <1850° C; b.p. ....; sp. gr. 18.68; valence 4 or 6. Discovered by Klaproth in 1789; metal first prepared by Peligot in 1841. Uranium occurs in *pitchblende* (as uranous uranate, $U(UO_4)_2$). The free element is prepared by reduction of uranous chloride (UCl_4) with sodium and is a hard white metal; uranium is used chiefly in the form of the compounds which give a canary-yellow fluorescent glass, and a black pigment for china painting; and also in photography. Uranium compounds are radioactive (See Radioactive Elements).

Vanadium (Goddess *Vanadis*), V; at. wt. 50.95; at. no. 23; m.p. 1715° C; b.p. 3400° C; sp. gr. 5.87 (15°); valence 3 or 5. Discovered by Sefström in 1830; isolated by Roscoe in 1869. Vanadium occurs in *mettramite* (a lead-copper vanadate) and in *vanadinite* (a lead vanadate); Peru is the chief producer of the ore. The metal is obtained by reduction of the chloride in hydrogen forming a gray and very infusible metal. When alloyed with steel it increases the hardness. The vanadates

are employed in the preparation of aniline black and for coloring glass. The oxide is used as a catalyst.

Virginium (State of Virginia), Vi; at. wt. about 224; at. no. 87; valence 1. Discovered in 1929 by Dr. Fred Allison and co-workers of Alabama Polytechnic Institute by the magneto-optic method of analysis of *pollucite* and *lepidolite*. It has been found also in sea water, lake brine, Stassfurt deposits, *pitchblende*, *samarskite* and *monazite sands*. Virginium has the highest equivalent weight of any element. Named in honor of Virginia, where the discoverer was born.

Xenon (Gr. *xenon*, stranger), Xe; at. wt. 131.3; at. no. 54; m.p. −112; b.p. −107.1; density 5.85 g/l; sp. gr. 3.06 (−109.1°); valence 0. Discovered by Ramsay and Travers in 1898 in the residue left on evaporating liquid air. It is the rarest and heaviest of the gases of the argon family and is present in the atmosphere to the extent of about one part in twenty million. It is inert and forms no compounds with other elements. The price of xenon in 1928 was about $15 per cm^3.

Ytterbium (Ytterby, town in Sweden), Yb; at. wt. 173.04; at. no. 70; m.p. 1800° C; b.p. . . . . ; sp. gr. . . . . ; valence 3. Separated by Marignac in 1878. In 1907 Urbain and in 1908 von Welsbach described a process by which this ytterbium could be resolved into two elements—neo-ytterbium or simply ytterbium and lutecium. These elements occur in nearly all the minerals which contain yttrium but in very small amounts. The best sources are probably *gadolinite*, *xenotime*, *polycrase* and *blomstrandine*. The oxides, chlorides and sulfates of these elements have been prepared.

Yttrium (Ytterby, town in Sweden), Y; at. wt. 88.92; at. no. 39; m.p. 1490° C; b.p. 2500° C; sp. gr. 5.51; valence 3. Yttria was discovered by Gadolin in 1794; in 1843 Mosander showed that yttria could be resolved into three elements, the name yttria being reserved for the most basic one, the others being named erbia and terbia. Yttrium occurs in nearly all the rare earths but mostly in *gadolinite*, *xenotime*, *euxonite*, *polycrase* and *samarskite*. Wöhler obtained the free element by reduction of the chloride with potassium; it has also been obtained by electrolysis of a mixture of the chloride and sodium chloride. The metal forms small scales with a metallic luster and an iron-gray color; it is readily oxidized in air and is converted to the hydroxide by boiling water.

Zinc (G. *Zink*), Zn; at. wt. 65.38; at. no. 30; m.p. 419.4° C; b.p. 907° C; sp. gr. 7.14 (20°); valence 2. Early used for making brass, but not recognized as a separate metal until Marggraf obtained it by heating calamine with charcoal in 1746. The principal ores of zinc are the sulfide (*sphalerite* or *blende*), the carbonate (*smithsonite*), the oxide (*zincite*), and the silicates (*willemite* and *calamine*). The old retort method of heating the roasted ore with carbon has been replaced to some extent by the electrolytic process. Zinc is a bluish-white metal which is brittle at ordinary temperatures but becomes malleable at 100° C, a fair conductor of electricity and burns in air at a high

red heat with evolution of white clouds of the oxide. It is used to alloy with other metals—*e.g.*, with copper it forms brass. Galvanizing consists in coating other metals with zinc to prevent corrosion. It is used as the negative electrode in various types of electric batteries. The most important compounds are the oxide, the sulfate and the chloride. The price of the metal, which was very high during the World War, was below 4¢ a pound in 1933.

Zirconium (Arabic, *zargun*, gold color), Zr; at. wt. 91.22; at. no. 40; m.p. 1700° C; b.p. >2900° C; sp. gr. 6.4; valence 4. Discovered in *zircon* by Klaproth in 1789; isolated by Berzelius in 1824. Zirconium occurs as the silicate in *zircon* and *hyacinth*. It is prepared from the fluorine-potassium compound by displacement with aluminum or sodium and forms silvery gray scales or an amorphous black powder. The oxide has been used in the preparation of incandescent gas mantles, in paints and lacquers, in insulators, as an abrasive; and colored varieties of the naturally occurring silicates are used as gems. The price of the pure oxide in 1925 was about 45¢ to 50¢ per pound.

LIGHT METALS — HEAVY METALS — NON-METALS — INERT GASES

The different thicknesses of the sloping lines represent different degrees of similarity between A-Groups and B-Groups. Thus IVA and IVB are very closely related, but IA and IB only slightly.

The scale at the bottom of the table gives the most important valences (valence numbers) for each element. A valence number in excess of +3 is usually shown only when the given element is in association with another (commonly oxygen), Mn, for example, in permanganate-ion, MnO_4^-, has a valence number of +7

Figures in bold-faced type indicate completed groups of electrons

RADIOACTIVITY, PROPERTIES OF RAYS

Range of the α particle is given for air at 76 cm and 0°C. Velocity is given relative to that of light; values in cm/sec will be obtained by multiplying the value of V by 3×10^{10}.

If μ is the absorption coefficient, d the thickness of the absorbing medium, I_o the intensity before passage, I the intensity after passage,—$I = I_o e^{-d\mu}$. The absorption coefficient is given in terms of centimeters of aluminum or lead as indicated.

Name	α Rays		β Rays		γ Rays

Don M. Yost, Calif. Inst. of Tech.

EXPLANATION OF TABLE

The table presents data for about thirty-five hundred compounds. It is intended to include all important, definite compounds for which information is available. It has been necessary to omit many compounds known to exist because of lack of data.

Arrangement.—The compounds have been listed under the names of the elements in alphabetical order. Ferrous and ferric salts will be found under iron, stannous and stannic, under tin and aurous and auric, under gold. The alums are generally listed under the name of the trivalent element. The **Metal-Organic Compounds** are given in a separate list following the main table. These compounds are also arranged in the alphabetical order of the elements. Double salts are not listed twice; if not found under the name first sought they should be looked for under the name of the other metal. The finding of compounds commonly known under names other than those listed is facilitated by a **Synonym Index** which precedes the table.

Molecular weights have been computed to the nearest hundredth, based on the **International Atomic Weights of 1933.**

The **Crystalline form and color** are stated in easily interpreted abbreviations. Other important characteristics are often added. **Indices of refraction** are given in the same column. For crystals with two or three indices, they are invariably given in the order ω, ϵ or α, β, γ. All indices are for Sodium light (λ = .5893μ) unless otherwise stated. The temperature is assumed to be normal room temperature unless otherwise indicated by a superior figure following the index. 1.536^{25} (Li) would be interpreted as giving the value for the index of refraction of a substance for the red line of Lithium at 25°C.

Specific gravity at 20°C, referred to water at 4°C, is normally given. Other temperatures are indicated by superior and inferior figures. For example: 2.64^{25}_{15} indicates a specific gravity of 2.64 at 25°C, referred to water at 15°C. It should be noted that values of specific gravity referred to water at 4°C are numerically equivalent to density in grams per milliliter. The **density of gases** is given in grams per liter indicated g/l.

Melting and boiling points are given in °C. The boiling point is stated at normal atmospheric pressure (760 mm of Hg) unless otherwise indicated by a superscript which is to be interpreted as the pressure in mm of Hg under which the compound boils at the temperature given. For example: 250^{732} indicates a boiling point of 250°C under a pressure of 732 mm Hg; $426^{2\,\mathrm{atm.}}$ indicates a boiling point of 426°C under a pressure of 2 atmospheres. Decomposition on heating is indicated by the abbreviation d. in melting or boiling point column. If decomposition occurs without change of state, the form d. 120 is used indicating the occurrence of decomposition at 120°C. The form 120 d. would indicate a melting or boiling point of 120°C with decomposition. Loss of water of crystallization or oxygen is indicated by the form $-2H_2O$ or -0. The figures $-5H_2O$, 350 indicate the loss of five molecules of water of crystallization at 350°C.

Solubilities are stated for normal room temperatures, 20°C, unless otherwise indicated by a superior figure. 6.8^{25} indicates a solubility of 6.8 grams of substance in 100 cm³ of the solvent at 25°C. The term insoluble (i.) must be usually understood to mean that a negligible quantity of the compound dissolves. A large proportion of salts commonly regarded as insoluble really dissolve to a very slight extent. The form s.d. indicates solubility with more or less decomposition. The abbreviation d. alone in the solubility column indicates that decomposition is the primary action occurring. Solubility in acids and alkalies is usually understood to be accompanied by decomposition.

ABBREVIATIONS

a.	acid
abs.	absolute
acet.	acetone

SYNONYM INDEX

Compound sought	Listed	Compound sought	Listed
Alum, ammonium	Aluminum ammonium sulfate	Alum, common	Aluminum potassium sulfate
Alum, ammonium chrome	Chromium ammonium sulfate	Alum, iron ammonium	Iron ammonium sulfate (ic)
Alum, ammonium gallium	Gallium ammonium sulfate	Alum, iron potassium	Iron potassium sulfate
Alum, cesium	Aluminium cesium sulfate	Alum, potassium (kalinite)	Aluminum potassium sulfate

SYNONYM INDEX (Continued)

Compound sought	Listed
Alum, potassium chrome	Chromium potassium sulfate
Alum, rubidium	Aluminum rubidium sulfate
Alum, sodium	Aluminum sodium sulfate
Alum, thallium	Aluminum thallium sulfate
Aluminates	under various metals
Arsenous salts	under Arsenic
Auric salts	under Gold
Aurichlorohydric acid	Gold, auric acid, chloro-
Aurobromohydric acid	Gold, auric acid, bromo-
Aurous salts	under Gold
Azoimide	Hydrazoic acid
Barium hyposulfate	Barium thionate, di-
Bicarbonate	Carbonate, acid
Bismuthic acid, meta-	Bismuth oxide, penta-
Borobutane	Boron hydride
Carbonyl compounds	under Carbon oxy-compounds
Ceric salts	under Cerium
Cerous salts	under Cerium
Chloroplatinic acid	Platinic acid, chloro-
Chromic salts	under Chromium
Chromous salts	under Chromium
Chromyl compounds	under Chromium oxy- compounds
Cobaltic salts	under Cobalt
Cobaltic chloride, luteo-	Cobalt complexes, Hexammine cobaltichloride
Cobaltic chloride, pupureo-	Cobalt complexes, Chloropentammine cobaltichloride
Cobaltic chloride, praseo-	Cobalt complexes, tetrammine cobaltichloride
Cobaltic chloride, roseo-	Cobalt complexes, Aquapentammine cobaltichloride
Cobalticyanic acid	Cyanic acid, cobalti-
Cobaltous salts	under Cobalt
Cupric salts	under Copper
Cuprous salts	under Copper
Disulfuryl chloride	under Sulfur pentoxydichloride
Ferric salts	under Iron
Ferrous salts	under Iron
Hexabromosilicoethane	Silicon bromide, tri-
Hexachlorosilicoethane	Silicon chloride, tri-
Hydriodic acid	Hydrogen iodide
Hydrobromic acid	Hydrogen bromide
Hydrochloric acid	Hydrogen chloride
Hydrocyanic acid	Hydrogen cyanide
Hydrofluoboric acid	Boric acid, fluo-
Hydrofluoric acid	Hydrogen fluoride
Hydrosulfides	under sulfhydrates
Hydrosulfuric acid	Hydrogen sulfide
Iodoplatinic acid	Platinic acid
Lead nitride	Lead azoimide
Mercuric salts	under Mercury
Mercurous salts	under Mercury
Nitrogen iodoazoimide	Nitrogen iodide, tri- (monoammonate)
Nitrosulfonic acid	Nitrosylsulfuric acid
Palladium potassium tetrachloride	Potassium chloropalladite
Per- acids	under Chlorine, bromine, sulfur, etc.
Peroxydisulfuric acid	Sulfuric acid, per-
Phosgene	Carbon oxychloride
Phosphine, gas	Hydrogen phosphide, H_3P
Phosphine, liquid	Hydrogen phosphide, H_4P_2
Phosphine, solid	Hydrogen phosphide $(H_2P_4)_3$
Phosphonitrile bromide	Phosphorus bromonitride
Phosphonitrile chloride	Phosphorus chloronitride
Potassium cobaltinitrite	Cobalt potassium nitrite (ic)
Potassium metabisulfite	Potassium *pyro*sulfite
Phosphoretted hydrogen	Hydrogen phosphide
Phosphorus hydride	Hydrogen phosphide
Platinum, ammonium hexabromide	Ammonium bromoplatinate
Platinum ammonium chloride	Ammonium chloroplatinite
Potassium cobaltinitrite	Cobalt potassium nitrite (ic)
Potassium cobaltosulfate	Cobalt potassium sulfate (ous)
Pyrosulfuryl chloride	Sulfur pentoxy dichloride
Selenium hydride	Hydrogen selenide
Silicane compounds	under Silicane
Silicanes	under Silicon hydrides
Silicobutane	Silicon hydride
Silicoethane	Silicon hydride
Silicopropane	Silicon hydride
Stannic salts	under Tin
Stannous salts	under Tin
Sulfuryl chloride	Sulfuric chloride
Sulfuryl fluoride	Sulfuric oxyfluoride
Tellurium hydride	Hydrogen telluride
Thiocyanic acid	Cyanic acid, thio-
Thionyl compounds	under Sulfur
Thiophosgene	Carbon thionyl chloride
Uranyl hydroxide	Uranic acid
Uranyl oxide	Uranium oxide, tri-

PHYSICAL CONSTANTS OF ORGANIC COMPOUNDS

The naming and arrangement of compounds, the preparation of the abridged form of the International Union Rules for the Naming of Organic Compounds and the Prefix Names of Organic Radicals have been in charge of

Austin M. Patterson, Ph.D.,
Professor of Chemistry and Vice President, Antioch College

The persons named below have rendered invaluable assistance in the revision of this table. Their cooperation is gratefully acknowledged by the Editor and Publishers of the Handbook of Chemistry and Physics.

H. W. Adams, Ill. State Normal Univ.

P. M. Apfelbaum, Coll. of the City of N. Y.

V. C. Aungier, Niagara Univ.

P. R. Austin, E. I. Du Pont de Nemours & Co.

V. S. Babasinian, Lehigh University

J. C. Bailar, Univ. of Ill.

G. W. Bennett, Grove City College

J. A. Bradley, Newark Tech. School

C. M. Brewster, State Coll. of Wash.

C. W. Burchard, A. & M. Coll. of Tex.

J. W. Chittum, Coll. of Wooster

G. H. Coleman, State Univ. of Iowa

Graham Cook, Albright Coll.

W. A. Cook, Univ. of Akron

J. E. Copenhaver, Univ. of S. Car.

D. L. Cottle, Rutgers Univ.

H. I. Cramer, University of Akron

E. F. Degering, Purdue Univ.

Clara deMilt, Tulane Univ.

H. W. Doughty, Amherst Coll.

H. L. Dunlap, Mo. School of Mines

M. S. Dunn, Univ. of Calif. at Los Angeles

P. W. Evans, Hastings Coll.

Le Roy Gibson, Univ. of N. Mex.

W. A. Gilkey, Sacramento Jr. Coll.

Henry Gilman, Ia. State Coll. of A. & M. Arts

R. C. Goodwin, Tex. Tech. Coll.

R. I. Grady, Coll. of Wooster

L. S. Guss, S. Dak. State Coll. of A. & M. Arts

H. B. Hass, Purdue Univ.

G. F. Hennion, Univ. of Notre Dame

W. B. Holton, American Univ.

J. W. Howard, Mont. State Univ.

C. D. Hurd, Northwestern Univ.

R. E. Hussey, Va. Polytechnic Inst.

E. M. Jones, Adrian Coll.

R. J. Kaufman, Univ. of Tulsa

H. J. King, Fresno State Teachers Coll.

C. R. Kinney, Univ. of Utah

S. S. Kistler, Norton Company

Alexander Lowy, Univ. of Pittsburgh

R. E. Lyons, Ind. Univ.

M. M. MacMasters, Univ. of Ill.

C. S. Marvel, Univ. of Ill.

J. P. Mason, Boston Univ.

J. P. Montgomery, Univ. of Ala.

W. M. Morgan,
Mount Union Coll.

Roger Mullinex,
Long Beach Jr. Coll.

A. M. Pardee,
Univ. of S. Dak.

F. N. Peters,
Quaker Oats Co.

C. B. Pollard,
Univ. of Fla.

H. W. Post,
Univ. of Buffalo

W. M. Potts,
A. & M. Coll. of Tex.

S. G. Powell,
Univ. of Wash.

L. C. Raiford,
State Univ. of Ia.

A. W. Ralston,
Armour & Co.

F. E. Ray,
Univ. of Cincinnati

G. R. Robertson,
Univ. of Calif.

C. J. Robinson,
Pomona Coll.

Edward Rosendahl,
Glyco Products Co.

E. R. Schierz,
Univ. of Wyo.

W. H. Schuyler,
Bucknell Univ.

O. E. Sheppard,
Mont. State Coll.

R. L. Shriner,
Univ. of Ill.

Lawrence Smith,
Los Angeles By-Products Co.

J. G. Smull,
Lehigh Univ.

C. C. Spencer,
Syracuse Univ.

M. A. Spielman,
Univ. of Ill.

Sherlock Swann, Jr.,
Univ. of Ill.

Technical Div.,
Carbide & Carbon Chemicals Corp.

P. L. Turrill,
Glendale Junior Coll.

H. B. Vickery,
Conn. Agr. Exp. Sta.

Nell Ward,
Municipal Univ. of Omaha

L. S. Weatherby,
Univ. of Southern Calif.

R. B. Whitney,
Amherst Coll.

L. F. Williams,
Univ. of N. Car.

J. H. Wilson,
Lafayette Coll.

L. E. Wise,
Rollins Coll.

W. J. Wohlleben,
Univ. of Dayton

C. B. Wooster,
Brown Univ.

G. R. Yohe,
Ohio Wesleyan Univ.

INTERNATIONAL UNION RULES FOR THE NAMING OF ORGANIC COMPOUNDS

Editor's Note.—These rules are taken from the "Definitive Report of the Commission on the Reform of the Nomenclature of Organic Chemistry," which was unanimously adopted by the Commission and by the Council of the International Union of Chemistry at Liége in 1930. A translation of the report, with comments, appeared in the *Journal of the American Chemical Society*, **55**, 3905–25 (1933), and the reader is referred there for the full text and more extended comments. The comments here given in fine type are the editor's. A. M. P.

I. General

1. As few changes as possible will be made in terminology universally adopted.

2. For the present, only the nomenclature of compounds of known constitution will be dealt with; the question of substances of imperfectly known constitution is postponed.

3. The precise form of words, endings, etc., prescribed in the rules should be adapted to the genius of each language by the subcommittees.

II. Hydrocarbons

4. The ending *ane* is adopted for saturated hydrocarbons. Open-chain hydrocarbons will have the generic name *alkanes*.

5. The present names of the first four normal saturated hydrocarbons (methane, ethane, propane, butane) are retained. Names derived from the Greek or Latin numerals will be used for those having more than four atoms of carbon.

As the names in this series are also used in forming names of unsaturated hydrocarbons, of alcohols, aldehydes, acids, etc. a list of them is here given, with the numbers of carbon atoms:

1 Methane
2 Ethane
3 Propane
4 Butane
5 Pentane
6 Hexane
7 Heptane
8 Octane
9 Nonane
10 Decane
11 Hendecane (Undecane)
12 Dodecane
13 Tridecane
14 Tetradecane
15 Pentadecane
16 Hexadecane
17 Heptadecane
18 Octadecane
19 Nonadecane
20 Eicosane
21 Heneicosane
22 Docosane
23 Tricosane
24 Tetracosane
25 Pentacosane
26 Hexacosane
27 Heptacosane
28 Octacosane
29 Nonacosane
30 Triacontane
31 Hentriacontane
32 Dotriacontane
33 Tritriacontane
34 Tetratriacontane
35 Pentatriacontane
36 Hexatriacontane
37 Heptatriacontane
38 Octatriacontane
39 Nonatriacontane
40 Tetracontane
41 Hentetracontane
42 Dotetracontane
43 Tritetracontane
44 Tetratetracontane
45 Pentatetracontane
46 Hexatetracontane
47 Heptatetracontane
48 Octatetracontane
49 Nonatetracontane
50 Pentacontane
51 Henpentacontane
52 Dopentacontane
53 Tripentacontane

54 Tetrapentacontane
55 Pentapentacontane
56 Hexapentacontane
57 Heptapentacontane
58 Octapentacontane
59 Nonapentacontane
60 Hexacontane

6. Branched-chain hydrocarbons are regarded as derivatives of the normal hydrocarbons; their names will be referred to the longest normal chain present in the formula by adding to it the designations of the side chains. In case of ambiguity, or if a simpler name would result, that chain which admits of the maximum of substitutions will be selected as the fundamental chain.

A simple example is 2-methylbutane, $CH_3CH(CH_3)CH_2CH_3$. The principle of "maximum of substitutions" may be illustrated as follows: In the compound

$$\begin{array}{l} CH_3CH_2CH_2CH_2\overset{}{C}HCH_2CH_2CH_2CH_3 \\ \qquad\qquad\qquad\quad\;\; | \\ \qquad\qquad\qquad\quad\;\; CH(CH_3)CH(CH_3)CH_3 \end{array}$$

the longest straight chain contains nine carbon atoms, which would lead to the name 5-(1, 2-dimethylpropyl)nonane; the number of substitutions in the main chain is only one, but the radical is a complicated one. By selecting a chain of eight we get three substitutions of simpler radicals and arrive at the name 4-butyl-2,3-dimethyloctane. Rules 6 and 7 apply to saturated hydrocarbons only.

7. In case there are several side chains, the order in which such chains are named will correspond to the order of their complexity. The chain having the greatest number of secondary and tertiary atoms will be considered the most complex. The alphabetic order may also be followed in such cases.

Two possible orders to be followed in arranging the names of substituting radicals in a compound are here referred to. In the "order of complexity" the radical of lowest weight comes first, then that of next lowest weight, and so on; of those having the same weight the least branched comes first and the most branched last, thus: methyl, ethyl, propyl, isopropyl, butyl, isobutyl, etc. The "alphabetic order" would of course be: butyl, ethyl, isobutyl, isopropyl, methyl, propyl (or else butyl, *iso*butyl, ethyl, methyl, propyl, *iso*propyl). (The alphabetic order is followed in the Organic Table in this handbook.)

8. In the names of open-chain unsaturated hydrocarbons having one double bond the ending *ane* of the corresponding saturated hydrocarbon will be replaced by the ending *ene;* if there are two double bonds, the ending will be *diene*, etc. These hydrocarbons will bear the generic names *alkenes*, *alkadienes*, *alkatrienes*, etc. Examples: propene, hexene, etc.

9. The names of triple-bond hydrocarbons will end in *yne*, *diyne*, etc. They will bear the generic name *alkynes*. Examples: propyne, heptyne, etc.

The ending *-yne* replaces *-ine* because the latter is reserved for bases (see Rule 33).

10. If there are both double and triple bonds in the fundamental chain the endings *enyne*, *dienyne*, etc., will be used. The generic names of these hydrocarbons will be *alkenynes*, *alkadienynes*, etc.

The double bonds are expressed first in the name (ene before yne) and take precedence in numbering (cf. Rule 64). Example: CH_2:CHCH:CH-C:CH, hexa-1,3-dien-5-yne, not hex-1-yne-3,5-diene. No provision is made for branched unsaturated hydrocarbons. It seems best, for general use, to select as the fundamental straight chain the longest one that contains the maximum of double and triple bonds. Example: CH_2:C(C_2H_5)CH_2CH_3, 2-ethyl-1-butene, not 3-methylenepentane.

11. Saturated monocyclic hydrocarbons will take the names of the corresponding open-chain saturated hydrocarbons, preceded by the prefix *cyclo*. They will bear the generic name *cycloalkanes*.

Examples: cyclopropane, cyclobutane, cycloheptane.

12. When they are unsaturated, rules 8–10 will be applied. However, in the case of partially saturated polycyclic aromatic compounds the prefix *hydro*, preceded by *di*-, *tetra*-, etc., will be used. Example: dihydroanthracene.

Further examples: cyclobutadiene, cyclohexene (not tetrahydrobenzene).

13. Aromatic hydrocarbons will be denoted by the ending *ene* and will otherwise retain their customary names. However, the name *phene* may be used instead of benzene.

Examples: benzene, toluene, xylene (not benzol, toluol, xylol).

III. Fundamental Heterocyclic Compounds

14. The endings of customary names, endings which do not correspond to the function of the substance, will undergo the following modifications, so far as they are in accord with the genius of each language: (a) The ending *ol* will be changed to *ole*. Example: pyrrole. (b) The ending *ane* will be changed to *an*. Example: pyran.

15. When nitrogenous heterocycles not having the ending *ine* give basic compounds on progressive hydrogenation, such derivation will be indicated by the successive endings *ine*, *idine*. Examples: pyrrole, pyrroline, pyrrolidine; oxazole, oxazoline.

16. The ending *a* is adopted for hetero atoms occurring in a ring. Oxygen will accordingly be indicated by *oxa*, sulfur by *thia*, nitrogen by *aza*, etc. The letter *a* may be elided before a vowel. Examples: thiadiazole, oxadiazole, thiazine, oxazine.

While the universally accepted names of heterocyclic compounds are retained, the names of other heterocyclic compounds are derived from that of the corresponding homocyclic compound by adding to it the names of the hetero atoms ending in *a*. Example: 2, 7, 9-triazaphenanthrene.

The custom of naming complex heterocyclic ring systems from the names of their component rings (as, anthrapyrrole, naphthopyridine) is so "universally accepted" that it will no doubt continue to be followed. The rule adds a useful new device for certain cases.

IV. Simple Functions

17. Substances of simple functions are defined as those containing a function of one kind only, which may be repeated several times in the same molecule.

That is, an alcohol may have one, two or more OH groups and still be a substance of simple function, while a hydroxy aldehyde or an amino acid is one of complex function.

18. When there is only one functional group, the fundamental chain will be selected so as to contain this group. When there are several functional groups the fundamental chain will be selected so as to contain the maximum number of these groups.

Example: $CH_3CH_2CH(COOH)_2$, 2-ethylpropanedioic acid (ethylmalonic acid). According to the original Geneva system it was butanoic-2-methyloic acid.

19. Halogen derivatives will be designated by the name of the hydrocarbon from which they are derived, preceded by a prefix indicating the nature and number of the halogen atoms.

Examples: C_2H_5Cl, chloroethane; CH_2BrCH_2Br, 1, 2-dibromoethane.

20. Alcohols and phenols will be given the name of the hydrocarbon from which they are derived, followed by the suffix *ol*. In accordance with rule 1 names universally adopted will be retained, as: phenol, cresol, naphthol, etc.

This nomenclature may also be applied to heterocycles. Example: quinolinol.

Further examples: $CH_3CHOHCH_3$, 2-propanol; $C_6H_{11}OH$, cyclohexanol.

21. In naming polyhydric alcohols or phenols, one of the forms *di*, *tri*, *tetra*, etc., will be inserted between the name of the parent hydrocarbon and the suffix *ol*.

Examples: CH_2OHCH_2OH, 1, 2-ethanediol; *p*-$C_6H_4(OH)_2$, 1, 4-benzenediol.

22. The name *mercaptan* as a suffix is abandoned; this function will be denoted by the suffix *thiol*.

Examples: CH_3SH, methanethiol; CH_2SHCH_2SH, 1, 2-ethanedithiol.

23. Ethers are considered as hydrocarbons in which one or several hydrogen atoms are replaced by alkoxy groups. However, for symmetrical ethers the present nomenclature may be retained. Examples: $CH_3OC_2H_5$, methoxyethane; CH_3OCH_3, methoxymethane or methyl ether.

24. Oxygen linked, in a chain of carbon atoms, to two of these atoms will be denoted by the prefix *epoxy* in all cases where it would be unprofitable to name the substance as a cyclic compound. Examples: ethylene oxide = epoxyethane; epichlorohydrin = 3-chloro-1,2-epoxypropane; tetramethylene oxide = 1,4-epoxybutane.

25. Sulfides, disulfides, sulfoxides and sulfones will be named like the ethers, *oxy* being replaced by *thio*, *dithio*, *sulfinyl* and

sulfonyl, respectively. Examples: $CH_3SO_2C_2H_5$, methylsulfonylethane; $CH_3SC_3H_7$, methylthiopropane; $CH_3CH_2CH_2$-$SOCH_2CH_2CH_2CH_3$, 1-(propylsulfinyl)butane.

26. Aldehydes are characterized by the suffix *al* added to the name of the hydrocarbon from which they are derived; thioaldehydes, by the suffix *thial*. Acetals will be named as 1,1-dialkoxyalkanes.

Examples: CH_3CHO, ethanal; CHOCHO, ethanedial; CH_3CH_2CHS, propanethial; $CH_3C(OC_2H_5)_2$, 1,1-diethoxyethane; C_6H_5CHO, benzenecarbonal? (cf. rule 32, paragraph 2).

27. Ketones will receive the ending *one*. Diketones, triketones, thioketones will be designated by the suffixes *dione*, *trione*, *thione*.

Examples: CH_3COCH_3, 2-propanone; $CH_3COCOCH_3$, 2, 3-butanedione; $CH_3CSCH_2CH_3$, 2-butanethione; cyclohexanone.

28. The name *ketene* is retained.

Example: $(CH_3)_2C{:}CO$, dimethylketene.

29. For acids the rule of the Geneva nomenclature is retained. However, in cases where the use of that nomenclature would not be convenient the carboxyl group will be considered as a substituting group and the name of the acid will be formed by adding to the name of the hydrocarbon the suffix *carbonique* or *carboxylic*, according to the language.

Examples: CH_3CH_2COOH, propanoic acid; $HOOCCH_2COOH$, propanedioic acid; $HOOCCH_2CH(COOH)CH_2COOH$, 1, 2, 3-propanetricarboxylic acid. In the Geneva system the last-named compound would have been called pentanedioic-3-methyloic acid.

30. Acids in which an atom of sulfur replaces an atom of oxygen will be named according to the Geneva nomenclature. Example: ethanethioic, -thiolic, -thionic, -thionothiolic. If the carboxyl is considered as a substituent the compounds will be named *carbothioic* acids. The suffix *carbothiolic* will be used if it is certain that the oxygen of the OH group is replaced by sulfur; the suffix *carbothionic* if it is the oxygen of the CO group; the suffix *carbodithioic* will be used if both oxygen atoms are replaced.

Examples of the two systems of names: CH_3COSH or CH_3CSOH (either one), ethanethioic acid, methanecarbothioic acid; CH_3COSH, ethanethiolic acid, methanecarbothiolic acid; CH_3CSOH, ethanethionic acid, methanecarbothionic acid; CH_3CSSH, ethanethionothiolic acid, methanecarbodithioic acid.

31. The existing conventions will be retained for salts and esters.

Examples: Sodium butanoate or sodium salt of butanoic acid; diethyl 1,2-ethanedicarboxylate or diethyl ester of 1,2-ethanedicarboxylic acid; sodium acetate; methyl succinate.

32. Acid anhydrides will retain their present mode of designation according to the names of the corresponding acids. For names formed in accordance with the Geneva nomenclature,

the amides, amidoximes, amidines, imides and nitriles will be named like the acids by adding to the name of the corresponding hydrocarbon the endings *amide*, *amidine*, *amidoxime*, *imide*, and *nitrile*, respectively, while the halides will be named by combining *chloride*, etc., with the name of the radical. Examples: C_3H_7COCl, butanoyl chloride; $C_3H_7CONH_2$, butanamide; etc.

If the carboxyl is considered as a substituent the endings *carbonamide*, *carbonamidine*, *carbonamidoxime*, *carbonimide*, *carbonitrile* will be used. Examples: C_3H_7COCl, propanecarbonyl chloride; $C_3H_7CONH_2$, propanecarbonamide; etc.

33. The ending *ine* is reserved exclusively for nitrogenous bases. The present nomenclature of monoamines is retained. For polyamines, the name of the hydrocarbon will be followed by the suffixes *diamine*, *triamine*, etc.

For aliphatic compounds containing quinquevalent nitrogen the ending *ine* will be changed to *onium*. For cyclic substances containing quinquevalent nitrogen in the ring the ending *ine* will be changed to *inium;* for those with the ending *ole*, this will be changed to *olium*. Examples: pyridine, pyridinium; imidazole, imidazolium.

Further examples: CH_3NH_2, methylamine; $(CH_3)_2NH$, dimethylamine; $(CH_3)_3N$, trimethylamine; $NH_2CH_2CH_2NH_2$, 1, 2-ethanediamine; dextrin (not dextrine); glycerol (not glycerine).

34. The nomenclature of the derivatives of phosphorus, arsenic, antimony and bismuth, being very complicated, will be considered later.

35. Compounds derived from hydroxylamine by replacement of the hydrogen of the hydroxyl will be regarded as alkoxy derivatives; those in which an atom of hydrogen of the NH_2 group is replaced, as alkylhydroxylamines. Oximes will be named by adding the suffix *oxime* to the name of the corresponding aldehyde, ketone or quinone. Examples: $C_2H_5ONH_2$, ethoxyamine; C_2H_5NHOH, ethylhydroxylamine.

Further examples: $CH_3CH_2CH{:}NOH$, propanal oxime; $CH_3C({:}NOH)CH_3$, propanone oxime.

36. The generic term *urea* is retained; it will be used as a suffix for the alkyl and acyl derivatives of urea. Examples: butylurea, $C_4H_9NHCONH_2$; butyrylurea, $C_3H_7CONHCONH_2$. The bivalent radical -NHCONH- will be named *ureylene*.

37. The generic name *guanidine* is retained.

38. The name *carbylamine* is retained.

Example: C_2H_5NC, ethylcarbylamine (or ethyl isocyanide).

39. Isocyanic and isothiocyanic esters (RNCO, RNCS) will be named *isocyanates* and *isothiocyanates*.

40. The name *cyanate* is reserved for true esters which on saponification yield cyanic acid or its hydration products. The name *sulfocyanate* will be replaced by *thiocyanate*.

41. Nitro derivatives: no change in the present nomenclature.

Examples: C_6H_5NO, nitrosobenzene; $(NO_2)_3C_6H_2OH$, trinitrophenol.

42. Azo derivatives: the forms *azo*, *azoxy* are retained.

43. (a) Diazonium compounds, RN_2X, are named by addition of the suffix *diazonium* to the name of the parent substance (benzenediazonium chloride).

(b) Compounds having the same empirical formula but containing trivalent nitrogen will be named by replacing diazonium with *diazo* (benzenediazohydroxide).

(c) Substances of the type RN_2OM will be named *diazoates*.

(d) Compounds in which the two nitrogen atoms are united to a single carbon atom will be designated by the prefix *diazo* (diazomethane, diazoacetic acid).

(e) The term *diazoamino* is retained; however, these compounds may also be regarded as derivatives of triazene.

(f) Derivatives of the substances $H_2NNHNHNH_2$; $NH{:}NNHNH_2$; $NH{:}NNHN{:}NH$ will be named *tetrazanes*, *tetrazenes*, *pentazdienes*, etc.

Examples: (a) $C_6H_5N(\vdots N)Cl$, benzenediazonium chloride; (b) $C_6H_5N{:}NOH$, benzenediazohydroxide; (c) $C_6H_5N{:}NONa$, sodium benzenediazoate; (d) N_2CH_2, diazomethane; N_2CH_2COOH, diazoacetic acid, diazoethanoic acid or diazomethanecarboxylic acid; (e) $C_6H_5N{:}NNHC_6H_5$, diazoaminobenzene or 1,3-diphenyltriazene; (f) $C_6H_5NHNHNHNHC_6H_5$, 1,4-diphenyltetrazane; $C_6H_5N{:}NNHNH_2$, 1-phenyl-1-tetrazene.

44. Hydrazines are designated by the name of the alkyl radicals from which they are derived, followed by the suffix *hydrazine*. In cases where the amino group of carbonamides is replaced by the hydrazino group, the suffix *hydrazide* will be used. Hydrazo derivatives are regarded as derivatives of hydrazine. Examples: CH_3NHNH_2, methylhydrazine; $C_2H_5NHNHC_3H_7$, 1-ethyl-2-propylhydrazine; $C_3H_7CONHNH_2$, butyrohydrazide or propanecarbohydrazide.

45. Hydrazones and semicarbazones are named like the oximes. The term *osazone* is retained.

Examples: $CH_3CH{:}NNHC_6H_5$, ethanal (or acetaldehyde) phenylhydrazone; $(CH_3)_2C{:}NNHCONH_2$, propane (or acetone) semicarbazone.

46. The name *quinone* is retained.

Examples: *p*-benzoquinone or *p*-quinone, 1, 2-naphthoquinone or 1, 2-naphthaquinone, phenanthrenequinone or phenanthraquinone.

47. Sulfonic and sulfinic acids will be designated by adding the suffixes *sulfonic* and *sulfinic* to the name of the hydrocarbon. The analogous acids of selenium and tellurium will bear the names *alkaneselenonic* and *-seleninic* acids; *alkanetelluronic* and *-tellurinic* acids.

Examples: $C_2H_5SO_3H$, ethanesulfonic acid; $C_{10}H_6(SO_2H)_2$, naphthalenedisulfinic acid; CH_3SeO_3H, methaneselenonic acid; $C_6H_5TeO_2H$, benzenetellurinic acid.

48. Organometallic compounds will be designated by the names of the organic radicals united to the metal which they contain, followed by the name of the metal. Examples: dimethylzinc, tetraethyllead, methylmagnesium chloride.

However, if the metal is united in a complex manner it may be considered as a substituent. Example: $ClHgC_6H_4CO_2H$, chloromercuribenzoic acid.

49. The nomenclature of cyclic derivatives having side chains will be considered later.

50. If it is necessary to avoid ambiguity, the names of complex radicals will be placed in parentheses. Examples: (dimethylphenyl)amine = $(CH_3)_2C_6H_3NH_2$; dimethylphenylamine = $C_6H_5N(CH_3)_2$.

V. Complex Functions

51. For compounds of complex function, that is to say, for compounds possessing different functions, only one kind of function (the principal function) will be expressed by the ending of the name. The other functions will be designated by appropriate prefixes.

Example: 2-aminoethanol (not ethanolamine). By rule 1 very commonly used names like phenolsulfonic acid, naphthylaminesulfonic acid might still be used.

52. The following prefixes and suffixes will be used for designating the functions.

Function	Prefix	Suffix
Acid and derivatives	carboxy	carboxylic, carbonyl, carbonamide, etc., or oic, oyl, etc.
Alcohol	hydroxy	ol
Aldehyde	oxo, aldo (for aldehyde O) or formyl (for CHO)	al
Amine	amino	amine
Azo derivative	azo	. . .
Azoxy derivative	azoxy	. . .
Carbonitrile (nitrile)	cyano	carbonitrile or nitrile
Double bond	. . .	ene
Ether	alkoxy	. . .
Ethylene oxide, etc.	epoxy	. . .
Halide	halogeno (halo)	. . .
Hydrazine	hydrazino	hydrazine
Ketone	oxo or keto	one
Mercaptan	mercapto	thiol
Nitro derivative	nitro	. . .
Nitroso derivative	nitroso	. . .
Quinquevalent nitrogen	. . .	onium, inium (olium)
Sulfide	alkylthio	. . .
Sulfinic derivative	sulfino	sulfinic
Sulfone	sulfonyl	. . .
Sulfonic derivative	sulfo	sulfonic
Sulfoxide	sulfinyl	. . .
Triple bond	. . .	yne
Urea	ureido	urea

The order in which the functions are here listed has no significance; the rules do not establish any general order of precedence (cf. rules 7, 63).

53. The names of derivatives of fundamental heterocyclic substances will be formed according to the preceding rules.

Example: Hydroxyquinolinecarbonamide, not quinolinolcarbonamide.

VI. Radicals

54. Univalent radicals derived from saturated aliphatic hydrocarbons by removal of one atom of hydrogen will be named by replacing the ending *ane* of the hydrocarbon by the ending *yl*.

Examples: methyl, ethyl, pentyl (or amyl), etc. Since isopropylidene is recognized (rule 56) it was no doubt the intention of the Committee to recognize isopropyl similarly.

55. The names of univalent radicals derived from unsaturated aliphatic hydrocarbons will have the endings *enyl, ynyl, dienyl*, etc., the positions of the double or triple bonds being indicated by numerals or letters where necessary.

Examples: CH_2:CH—, ethenyl (or vinyl); CH⋮C—, ethynyl; CH_3—CH:CH—CH_2—, 2-butenyl; CH_2:CH—CH:CH—, 1, 3-butadienyl.

56. Bivalent or trivalent radicals derived from saturated hydrocarbons by removal of 2 or 3 hydrogen atoms from the same carbon atom will be named by replacing the ending *ane* of the hydrocarbon by the endings *ylidene* or *ylidyne*. For radicals derived from unsaturated hydrocarbons, these endings will be added to the name of the hydrocarbon. The names isopropylidene and methylene are retained.

Examples: $CH_2<$, methylene; $CH_3CH<$, ethylidene; $CH_3CH_2CH<$, propylidene; $(CH_3)_2C<$, (1-methylethylidene) or isopropylidene; CH_3C⋮, ethylidyne; CH_2:CH—$CH_2CH<$, 3-butenylidene.

57. The names of bivalent radicals derived from aliphatic hydrocarbons by removal of a hydrogen atom from each of the two terminal carbon atoms of the chain will be ethylene, trimethylene, tetramethylene, etc.

Only saturated radicals are provided for: —CH_2CH_2—, ethylene; —CH_2-CH_2CH_2—, trimethylene, etc.

58. Radicals derived from acids by removal of OH will be named by changing the ending carboxylic to *carbonyl* or, if the Geneva nomenclature is used, oic to *oyl*.

Examples: CH_3CO, ethanoyl or methanecarbonyl (or acetyl).

59. Univalent radicals derived from aromatic hydrocarbons by removal of a hydrogen atom from the ring will in principle be named by changing the ending *ene* to *yl*. However, the radicals C_6H_5 and $C_6H_5CH_2$ will continue provisionally to be named phenyl and benzyl respectively. Moreover, certain abbreviations sanctioned by usage are authorized, as *naphthyl* instead of *naphthalyl*.

Examples: $CH_3C_6H_4$—, tolyl (instead of toluyl), anthryl (instead of anthracyl), phenanthryl, fluoryl.

60. Univalent radicals derived from heterocyclic compounds by removal of hydrogen from the ring will be named by changing their endings to *yl*. In cases where this would give rise to ambiguity, merely the final *e* will be changed to *yl*. Examples: pyridine, pyridyl; indole, indolyl; pyrroline, pyrrolinyl; triazole, triazolyl; triazine, triazinyl.

61. Radicals formed by removal of a hydrogen atom from a side chain of a cyclic compound will be regarded as substituted aliphatic radicals.

Examples: $C_6H_5CH_2CH_2$—, (2-phenylethyl); $C_6H_5CH{:}CHCH_2$—, (3-phenyl-2-propenyl). (For $C_6H_5CH_2$, see rule 59.)

62. In general, special names will not be given to multivalent radicals derived from cyclic compounds by removal of several hydrogen atoms from the ring. In this case prefixes or suffixes will be used. Examples: triaminobenzene or benzenetriamine; dihydroxypyrrole or pyrrolediol.

Comparison with rules 21, 33 and 51 will show that of the names given as examples, "benzenetriamine" and "pyrrolediol" are the ones ordinarily to be preferred (according to the rule of expressing the principal function in the ending of the name where there is a suffix denoting it).

63. The order in which prefixes or radicals are stated (alphabetic order or conventional order) remains optional.

See the comments on rule 7. There is no generally accepted "conventional order" for all prefixes.

VII. Numbering

64. In aliphatic compounds the carbon atoms of the fundamental chain will be numbered from one end to the other with the use of arabic numerals. In case of ambiguity the lowest numbers will be given (1) to the principal function, (2) to double bonds, (3) to triple bonds, (4) to atoms or radicals designated by prefixes. The expression "lowest numbers" signifies those that include the lowest individual number or numbers. Thus, 1, 3, 5 is lower than 2, 4, 6; 1, 5, 5 lower than 2, 6, 6; 1, 2, 5 lower than 1, 4, 5; 1, 1, 3, 4 lower than 1, 2, 2, 4.

Examples: $CH_2{:}CHCH_2CH_3$, 1-butene (not 3-butene); $CH_2{:}CHC{:}CH$, 1-buten-3-yne (not 3-buten-1-yne); $CH_2{:}CH$—CH_2OH, 2-propen-1-ol (not 1-propen-3-ol; the name allyl alcohol may also be used); $CHCl_2$—$CH_2CH{:}CH_2$, 4, 4-dichloro-1-butene. The principle of "low numbers" also applies to cyclic compounds, with due regard to their different structures (e.g., bridges and hetero atoms are usually given preferred positions). Examples: 1, 3-cyclohexadiene; 3-cyclohexen-1-one or simply 3-cyclohexenone; 4, 4-dichlorocyclohexene.

Position of Numbers.—Where shall position numbers be placed, *before* or *after* the parts of the name to which they refer? Usage varies; some chemists place them before, some place them after, some use a combination. The Committee has left full latitude on this point. The examples in the French version usually show the numbers placed after; the examples in these comments follow the practice of *Chemical Abstracts* in being placed before. Each method has certain advantages. In Beilstein numbers placed after are in parentheses, those placed before are not, e.g., "2-methyl-butanol-(4)."

65. Positions in a side chain will be designated by numerals or letters, starting from the point of attachment. The numerals or letters will be in parentheses with the name of the chain.

Examples: $(CH_3)_2CH$—, (1-methylethyl) or isopropyl; $CH_3CHClCH_2$—, (2-chloropropyl). The rule equally permits Greek letters, ordinary letters, primed numbers (1′, 2′), numbers with indices (4^1, 4^2) or other designations.

66. In case of ambiguity in the numbering of atoms or radicals designated by prefixes, the order will be that chosen for the prefixes before the name of the fundamental compound or side chain of which they are substituents.

Example: $CH_2BrCH_2CH_2Cl$, 1-bromo-3-chloropropane (alphabetic order), or 1-chloro-3-bromopropane (order of increasing radical weight). The purpose of the rule is to decide which prefixes shall have which numbers, when the set of numbers (in the above example 1, 3) for the prefixes has been determined.

67. The prefixes, *di*, *tri*, *tetra*, etc. will be used before simple expressions (for example, diethylbutanetriol) and the prefixes *bis*, *tris*, *tetrakis*, etc., before complex expressions. Examples: bis(methylamino)propane, $CH_3NH(CH_2)_3NHCH_3$; bis-(dimethylamino)ethane, $(CH_3)_2NCH_2CH_2N(CH_3)_2$. The prefix *bi* will be used only to denote the doubling of a radical or compound; for example, biphenyl.

Additional example of the use of *bi:* *p*-$(C_6H_4CO_2H)_2$, 4, 4′-bibenzoic acid or biphenyl-4, 4′-dicarboxylic acid.

68. A catalog of cyclic systems, with their numberings according both to the existing system and to that of Mr. Patterson, is in preparation under the auspices of the National Research Council of the United States and of the American Chemical Society.

Work on this project is now in abeyance pending better financial conditions for publication.

In order to avoid all confusion the Commission recommends placing a scheme of numbering at the head of each article.

INDEX
to
INTERNATIONAL UNION RULES

(Numbers refer to the individual rules)

PREFIX NAMES OF ORGANIC RADICALS

NOTE: This compilation is substantially that published in the indexes to *Chemical Abstracts* with modifications resulting from recent international committee work.

A. M. P.

Name	Formula
acenaphthenyl (from acenaphthene)	$C_{12}H_9$—
acetamido	CH_3CONH—
acetenyl = ethynyl	
acetimido	$CH_3C(:NH)$—
acetonyl	CH_3COCH_2—
acetonylidene	CH_3COCH:
acetoxy	CH_3COO—
acetyl	CH_3CO—
acetylene	:CHCH:
acridyl (from acridine)	$C_{13}H_8N$—
acrylyl	$CH_2:CHCO$—
adipyl	—$OC(CH_2)_4CO$—
alanyl	CH_3CHNH_2CO—
aldo (O replacing H_2 to form HCO—)	O:
alkoxy (any alkyl radical attached by oxygen)	RO—
alkylthio (any alkyl radical attached by sulfur)	RS—
allyl (2-propenyl)	$CH_2:CHCH_2$—
β-allyl = isopropenyl	
amidoxalyl = oxamyl	
amino (amido)	H_2N—
amoxy	$CH_3(CH_2)_4O$—
amyl	$CH_3(CH_2)_4$—
tert-amyl	$(C_2H_5)(CH_3)_2C$—
amylidene	$CH_3(CH_2)_3CH$:
anilino	C_6H_5NH—
anisal	p-$CH_3OC_6H_4CH$:
anisoyl	p-$CH_3OC_6H_4CO$—
anisyl	(o, m or p)$CH_3OC_6H_4$—
anisylidene = anisal	
anthranilo	o-C_6H_4CON—
anthranoyl	o-$H_2NC_6H_4CO$—
anthraquinonyl (from anthraquinone, 2 isomers)	$C_{14}H_7O_2$—
anthryl (from anthracene, 3 isomers)	$C_{14}H_9$—
anthrylene (from anthracene)	$C_{14}H_8$:(11 isomers)
antimono	Sb:Sb—
antipyryl (from antipyrine)	$CO{\cdot}N(C_6H_5){\cdot}N(CH_3){\cdot}C(CH_3):C$—
arseno	—As:As—
arsenoso	O:As—
arsinico (from arsinic acid)	(HO)OAs:
arsino	H_2As—
arso	O_2As—
arsono (from arsonic acid)	$(HO)_2OAs$—
arsylene	HAs:
asaryl	2, 4, 5-$(CH_3O)_3C_6H_2$—
asparagyl	$H_2NCOCH_2CH(NH_2)CO$—
aspartyl	—$COCH_2CH(NH_2)CO$—
auro	Au—
azimino, azimido = diazoamino	
azido = triazo	

Name	Formula
azino	$:NN:$
azo	—$N:N$—
azoxy	—NON—
benzal	$C_6H_5CH:$
benzamido	C_6H_5CONH—
benzenyl	$C_6H_5C\vdots$
benzidino (from benzidine)	$H_2NC_6H_4C_6H_4NH$—
benzilyl	$(C_6H_5)_2C(OH)CO$—
benzimidazolyl (from benzimidazole)	$C_7H_5N_2$—
benzimido	$C_6H_5C(:NH)$—
benzofuryl (from benzofuran)	C_8H_5O—
benzohydryl	$(C_6H_5)_2CH$—
benzohydrylidene = diphenylmethylene	
benzopyranyl (from benzopyran, 2-α-, etc.)	C_9H_7O—
benzoxazolyl (from benzoxazole)	C_7H_4NO—
benzoxy	C_6H_5COO—
benzoyl	C_6H_5CO—
benzoylene	—C_6H_4CO—
benzyl	$C_6H_5CH_2$—
benzylidene = benzal	
biphenylene	—$C_6H_4C_6H_4$—
biphenylenedisazo	—$N:NC_6H_4C_6H_4N:N$—
bornyl (from borneol)	$C_{10}H_{17}$—
boryl	$O:B$—
bromo	Br—
1-butenyl	$CH_3CH_2CH:CH$—
2-butenyl	$CH_3CH:CHCH_2$—
3-butenyl	$CH_2:CH(CH_2)_2$—
butoxy	$CH_3(CH_2)_3O$—
butyl	$CH_3(CH_2)_3$—
sec-butyl	$(C_2H_5)(CH_3)CH$—
tert-butyl	$(CH_3)_3C$—
butylene (1, 4) = tetramethylene	
butylidene	$CH_3(CH_2)_2CH:$
butyryl	$CH_3(CH_2)_2CO$—
a mphanyl (from camphane, 3 isomers)	$C_{10}H_{17}$—
camphoroyl (from camphoric acid)	$C_{10}H_{14}O_2:$
camphoryl (from camphor)	$C_{10}H_{15}O$—
camphorylidene (from camphor)	$C_{10}H_{14}O:$
caproyl	$CH_3(CH_2)_4CO$—
capryl	$CH_3(CH_2)_8CO$—
caprylyl	$CH_3(CH_2)_6CO$—
carbamido = ureido	
carbamyl	H_2NCO—
carbanilino = phenylcarbamyl	
carbazyl (from carbazole, 5 isomers)	$C_{12}H_8N$—
carbethoxy	C_2H_5OOC—
carbomethoxy	CH_3OOC—
carbonyl	$OC:$
carbonyldioxy	—$OCOO$—
carboxy	$HOOC$—
carbyl	—C—
carvacryl (from carvacrol)	$C_{10}H_{13}$—
cetyl	$CH_3(CH_2)_{14}CH_2$—
chloro	Cl—
chloromercuri	$ClHg$—
cinnamal	$C_6H_5CH:CHCH:$
cinnamenyl = styryl	
cinnamyl	$C_6H_5CH:CHCO$—
cinnamylidene = cinnamal	

Name	Formula
citral (from citraldehyde)	$C_9H_{15}CH:$
cresotyl (from cresotic acid)	$HO(CH_3)C_6H_3CO$—
cresoxy = toloxy	
cresyl (10 isomers)	(*o*, *m* or *p*)$(HO)(CH_3)C_6H_3$—
cresylene = tolylene	
crotonyl	$CH_3CH:CHCO$—
cumal	*p*-$(CH_3)_2CHC_6H_4CH:$
cumenyl	$(CH_3)_2CHC_6H_4$—
cumidino	$(CH_3)_2CHC_6H_4NH$—
cuminal = cumal	
cyano	$N\vdots C$—
cyclobutyl	$CH_2CH_2CH_2CH$—
cyclohexadienyl (2, 4, etc.)	C_6H_7—
cyclohexadienylidene (2, 4, etc.)	$C_6H_6:$
cyclohexenyl (from cyclohexene, 3 isomers)	C_6H_9—
cyclohexyl (from cyclohexane)	C_6H_{11}—
cyclohexylidene	$CH_2CH_2CH_2CH_2CH_2C:$
cyclopentenyl (from cyclopentene)	C_5H_7—
cyclopentyl (from cyclopentane)	C_5H_9—
cyclopropyl	CH_2CH_2CH—
cymyl (from cymene)	$C_{10}H_{13}$—
2-*p*-cymyl = carvacryl	
3-*p*-cymyl = thymyl	
desyl	$(C_6H_5)(C_6H_5CO)CH$—
diazo	—$N:N$—
diazoamino	—$N:NNH$—
diazoxy	—$N(:O):N$—
dithio	—SS—
duryl	2, 3, 5, 6-$(CH_3)_4C_6H$—
durylene	2, 3, 5, 6-$(CH_3)_4C_6:$
epoxy	—O—(to different radicals already united in some other way)
ethene = ethylene	
ethenyl = vinyl; = ethylidyne	
ethoxalyl	C_2H_5OOCCO—
ethoxy	C_2H_5O—
ethyl	CH_3CH_2—
ethylene	—CH_2CH_2—
ethylenedioxy	—$O(CH_2)_2O$—
ethylidene	$CH_3CH:$
ethylidyne	$CH_3C\vdots$
ethynyl	$HC\vdots C$—
ethynylene	—$C\vdots C$—
fenchyl (from fenchyl alcohol)	$C_{10}H_{17}$—
fluoro	F—
fluoryl (from fluorene, 5 isomers)	$C_{13}H_9$—
fluorylidene	$C_{13}H_8:$
formamido	$HCONH$—
formazyl	$(C_6H_5N:N)(C_6H_5NHN:)C$—
formyl	HCO—
fural (2 isomers)	$OCH:CHCH:CCH:$
furfural = fural	
furfuryl = furyl	
furfurylidene = fural	
2-furoyl = pyromucyl	
3-furoyl	$CH:CH\cdot O\cdot CH:CCO$—
furyl (from furan, 2 isomers)	C_4H_3O—

Name	Formula
furylidene, 3(2)-form	$CH{:}CH{\cdot}O{\cdot}CH_2{\cdot}C{:}$ (also a 2(3)-form)
geranyl (from geraniol)	$C_{10}H_{17}$—
glutamyl	—$OCCH(NH_2)(CH_2)_2CO$—
glutaryl	—$OC(CH_2)_3CO$—
glyceryl	—$CH_2(CH$—$)CH_2$—
glycolyl	$HOCH_2CO$—
glycyl	H_2NCH_2CO—
glyoxyl	HCOCO—
guaiacyl = *o*-anisyl	
guanido	$H_2NC({:}NH)NH$—
guanyl	$H_2NC({:}NH)$—
halogeno, halo (any halogen atom)	Hl—
hendecyl	$CH_3(CH_2)_{10}$—
heptyl	$CH_3(CH_2)_6$—
hexadecyl = cetyl	
hexyl	$CH_3(CH_2)_5$—
hippuryl	$C_6H_5CONHCH_2CO$—
homopiperonyl	3, 4-$(CH_2O_2)C_6H_3CH_2CH_2$—
hydrazi	—NHNH—(to same atom)
hydrazino	H_2NNH—
hydrazo	—NHNH—(to different atoms)
hydrazono	$H_2NN{:}$
hydroxamino	HONH—
hydroximino = isonitroso	
hydroxy	HO—
imidazolyl (from imidazole, 4 isomers)	$C_3H_3N_2$—
imino (imido)	HN:
indanyl (from indan, 4 isomers)	C_9H_9—
indenyl (from indene, 7 isomers)	C_9H_7—
indolyl (from indole, 7 isomers)	C_8H_6N—
indolylidene (3(2) form shown)	$C_6H_4NHCH_2C{:}$
indyl = indolyl	
indylidene = indolylidene	
iodo	I—
iodoso	OI—
iodoxy	O_2I—
isoallyl = propenyl	
isoamoxy	$(CH_3)_2CHCH_2CH_2O$—
isoamyl	$(CH_3)_2CHCH_2CH_2$—
isoamylidene	$(CH_3)_2CHCH_2CH{:}$
isobutenyl	$(CH_3)_2C{:}CH$—
isobutoxy	$(CH_3)_2CHCH_2O$—
isobutyl	$(CH_3)_2CHCH_2$—
isobutyryl	$(CH_3)_2CHCO$—
isocyano	C:N—
isodiazo	—NHN: (to same atom)
isohexyl	$(CH_3)_2CH(CH_2)_3$—
isoindyl (from isoindole, 4 isomers)	C_8H_6N—
isoleucyl	$CH_3CH_2CH(CH_3)CH(NH_2)CO$—
isonitro	HOON:
isonitroso	HON:
1-isopentenyl	$(CH_3)_2CHCH{:}CH$—
isophthalal (isophthalylidene)	$:HCC_6H_4CH{:}(m)$
isopropenyl	$CH_2{:}C(CH_3)$—
isopropoxy	$(CH_3)_2CHO$—
isopropyl	$(CH_3)_2CH$—
isopropylidene	$(CH_3)_2C{:}$

Name	Formula
isoquinolyl (from isoquinoline, 9 isomers)	C_9H_6N—
isothiocyano	S:C:N—
isovaleryl	$(CH_3)_2CHCH_2CO$—
isoxazolyl (from isoxazole, 5 isomers)	(C_3H_2NO)—
keto	O: (to same atom; properly used for ketones only; cf. "oxo")
leucyl	$(CH_3)_2CHCH_2CH(NH_2)CO$—
malonyl	—$OCCH_2CO$—
menthyl (from menthane): as, 2-*p*-menthyl	$C_{10}H_{19}$—
mercapto	HS—
mercuri	—Hg—
α-mesityl	3.5-$(CH_3)_2C_6H_3CH_2$—
2-mesityl	2, 4, 6-$(CH_3)_3C_6H_2$—
methene = methylene	
methenyl = methylidyne	
methionyl	$CH_2(SO_2)_2{:}$
methoxy	CH_3O—
methyl	CH_3—
methylene	H_2C
methylenedioxy	—OCH_2O—
methylidyne	HC⋮
methylol = hydroxymethyl	
naphthal	$C_{10}H_7CH{:}$
naphthalimido (from naphthalic acid)	$C_{10}H_6(CO)_2N$—
naphthenyl	$C_{10}H_7C.$
naphthobenzyl	$C_{10}H_7CH_2$—
naphthoxy	$C_{10}H_7O$—
naphthoyl	$C_{10}H_7CO$—
naphthyl (1 or 2)	$C_{10}H_7$—
naphthylene	$C_{10}H_6{:}$
naphthylidene (1(4) form shown)	$C_6H_4CH_2CH{:}CH{\cdot}C$
nitramino	O_2NNH—
nitrilo	N⋮
nitro	O_2N—
aci-nitro = isonitro	
nitroso	ON—
norcamphanyl (from norcamphane)	C_7H_{11}—
octyl	$CH_3(CH_2)_7$—
oxalyl	—OCCO—
oxamido	$H_2NCOCONH$—
oxamyl	H_2NCOCO—
oximido = isonitroso	
oxo	O: (to same atom; broader than "keto")
oxy	—O—(used as a connective; cf. aldo, epoxy, keto and oxo)
pentamethylene	—$CH_2(CH_2)_3CH_2$—
pentazyl	$N{:}N{\cdot}N{:}N{\cdot}N$—
pentenyl (like butenyl)	C_5H_9—
pentyl = amyl	
perimidyl (from perimidine, 8 isomers)	$C_{11}H_7N_2$—
perthio (replacing O only)	S:S:
phenacyl	$C_5H_5COCH_2$—
phenacylidene	$C_6H_5COCH{:}$
phenanthryl (from phenanthrene, 5 isomers)	$C_{14}H_9$—

Name	Formula
phenanthrylene (several isomers)	$C_{14}H_8$:
phenenyl (*s*, *as*-, *v*-)	C_6H_3:
phenethyl	$C_6H_5CH_2CH_2$—
phenetidino	$C_2H_5OC_6H_4NH$—
phenetyl (*o*, *m*, *p*)	$C_2H_5OC_6H_4$—
phenoxy	C_6H_5O—
phenyl	C_6H_5—
phenylazo	C_6H_5N:N—
phenylcarbamido = phenylureido	
phenylene (*o*, *m*, *p*)	C_6H_4:
phenylenedisazo (*o*, *m*, *p*)	—N:NC_6H_4N:N—
phenylidene = cyclohexadienylidene	
phenylureido	$C_6H_5NHCONH$—
phospharseno	—P:As—
phosphazo	—P:N—
phosphinico	(HO)OP:
phosphino	H_2P—
phospho	O_2P—
phosphono	$(HO)_2OP$—
phosphoro	—P:P—
phosphoroso	O:P—
phthalal	:HCC_6H_4CH: (*o*)
phthalamido	$HO_2C·C_6H_4·CONH$— (*o*)
phthalidene (from phthalide)	C_6H_4COOC:
phthalidyl	C_6H_4COOCH—
phthalimido	$C_6H_4(CO)_2N$— (*o*)
phthalyl	—OCC_6H_4CO— (*o*)
picryl	2, 4, 6-$(NO_2)_3C_6H_2$—
piperidyl (from piperidine, 4 isomers)	$C_5H_{10}N$—
piperonyl	3, 4-$(CH_2O_2)C_6H_3CH_2$—
piperonylidene	3, 4-$(CH_2O_2)C_6H_3CH$:
pivalyl (from pivalic acid)	$(CH_3)_3CCO$—
prolyl (from proline)	$NHCH_2CH_2CH_2CHCO$—
propargyl (2-propynyl)	HC:CCH_2—
propenyl (1-propenyl)	CH_3CH:CH—
propenylidene (1-propenylidene)	CH_3CH:C:
propiolyl	HC:CCO—
propionyl	CH_3CH_2CO—
propoxy	$CH_3CH_2CH_2O$—
propyl	$CH_3CH_2CH_2$—
propylene	—$CH(CH_3)CH_2$—
propylidene	CH_3CH_2CH:
pseudoallyl = isopropenyl	
as-pseudocumyl	2, 3, 5-$(CH_3)_3C_6H_2$—
s-pseudocumyl	2, 4, 5-$(CH_3)_3C_6H_2$—
v-pseudocumyl	2, 3, 6-$(CH_3)_3C_6H_2$—
pseudoindyl (from pseudoindole, 7 isomers)	C_8H_6N—
pyranyl (2-α, 2-γ, 3-α, etc.)	C_5H_5O
pyrazolyl (from pyrazole, 4 isomers)	$C_3H_3N_2$—
pyridyl (from pyridine, 3 isomers)	C_5H_4N—
pyridylidene (4(1) form shown)	CH:CHNHCH:CHC:
pyrimidyl (from pyrimidine)	$C_4H_3N_2$—
pyromucyl	OCH:CHCH:CCO—

Name	Formula
pyrrolidyl (from pyrrolidine, 3 isomers)	C_4H_8N—
pyrroyl	CH:CHCH:CHNCO
pyrryl (from pyrrole, 3 isomers)	C_4H_4N—
quinolyl (from quinoline, 7 isomers)	C_9H_6N—
quinonyl (from quinone)	$C_6H_3O_2$—
quinoxalyl (from quinoxaline)	$C_8H_5N_2$—
salicyl	HOC_6H_4— (*o*)
salicylal	HOC_6H_4CH: (*o*)
salicylyl	HOC_6H_4CO— (*o*)
selenino	(HO)OSe—
seleninyl	OSe:
seleno	Se:
selenocyano	NCSe—
selenono	HO_3Se—
selenonyl	—SeO_2—
selenyl	HSe—
semicarbazido	$H_2NCONHNH$—
silicono	(HO)OSi—
silicyl	H_3Si—
silicylene	H_2Si:
stannyl	H_3Sn—
stearyl	$CH_3(CH_2)_{16}CO$—
stibarseno	—Sb:As—
stibinico	(HO)OSb:
stibino	H_2Sb—
stibo	O_2Sb—
stibono	$(HO)_2OSb$—
stiboso	O:Sb—
stibylene	HSb:
styrene (styrolene)	—$CH(C_6H_5)CH_2$—
styryl	C_6H_5CH:CH—
succinamyl	$H_2NCOCH_2CH_2CO$—
succinyl	—$OCCH_2CH_2CO$—
sulfamino	HO_3SNH—
sulfamyl	H_2NO_2S—
sulfhydryl = mercapto	
sulfino	HO_2S—
sulfinyl	OS:
sulfo	HO_3S—
sulfonamido	—SO_2NH—
sulfonyl (sulfuryl)	—SO_2—
tauryl	$H_2NCH_2CH_2SO_2$—
telluro	Te:
terephthalal	:HCC_6H_4CH: (*p*)
tetramethylene	—$CH_2CH_2CH_2CH_2$—
tetrazyl (from tetrazole, 2 isomers)	CHN_4—
thenoyl (from thiophenecarboxylic acid, 2 isomers)	C_4H_3SCO—
thiazyl (from thiazole, 3 isomers)	C_3H_2NS—
thienyl (from thiophene, 2 isomers)	C_4H_3S—
thio	—S—
thiocarbonyl	SC:
thiocyano	NCS—
thiohydroxy = mercapto	
thiol (*S* replacing *O* in *OH*)	Used in place of "thio" when required for distinction
thiono (*S* replacing *O* in *CO*)	Used in place of "thio" when required for distinction
thionyl = sulfinyl	

Name	Formula
thujyl (from sabinane)	$C_{10}H_{17}$— (attached at one of 2 positions)
thymyl (from thymol)	$C_{10}H_{13}$—
toloxy (*o*, *m*, or *p*)	$CH_3C_6H_4O$—
toluino (*o*, *m*, or *p*)	$CH_3C_6H_4NH$—
toluyl (*o*, *m*, or *p*)	$CH_3C_6H_4CO$—
α-toluyl	$C_6H_5CH_2CO$—
tolyl (*o*, *m*, or *p*)	$CH_3C_6H_4$—
α-tolyl = benzyl	
tolylene (6 isomers)	$CH_3C_6H_3$:
α-tolylene = benzal	
triazeno	$H_2NN{:}N$—
triazinyl (from triazine)	$C_3H_2N_3$—
triazo	$N{:}N{\cdot}N$—
triazolyl (from triazole)	$C_2H_2N_3$—
trimethylene	—$CH_2CH_2CH_2$—
tryptophyl (from tryptophan)	$(C_{11}H_{11}N_2O)$—
tyrosyl (from tyrosine)	*p*-$HOC_6H_4CH_2CH(NH_2)CO$—
undecyl = hendecyl	
uramino = ureido	
ureido	H_2NCONH—
ureylene	—$NHCONH$—
valeryl	$CH_3(CH_2)_3CO$—
valyl (from valine)	$(CH_3)_2CHCH(NH_2)CO$—
vanillal	3, 4-$(CH_3O)(HO)C_6H_3CH$:
vanilloyl	3, 4-$(CH_3O)(HO)C_6H_3CO$—
vanillyl	3, 4-$(CH_3O)(HO)C_6H_3CH_2$—
veratral	3, 4-$(CH_3O)_2C_6H_3CH$:
veratroyl	3, 4-$(CH_3O)_2C_6H_3CO$—
veratryl	3, 4-$(CH_3O)_2C_6H_3CH_2$—
veratrylidene = veratral	
vinyl (ethenyl)	$H_2C{:}CH$—
vinylene	—$CH{:}CH$—
vinylidene (ethenylidene)	$H_2C{:}C$:
xanthyl (from xanthene, 6 isomers)	$C_{13}H_9O$—
xyloyl (from xylic acid, 7 isomers)	$(CH_3)_2C_6H_3CO$—
xylyl (dimethylphenyl)	$(CH_3)_2C_6H_3$—
xylylene	—$H_2CC_6H_4CH_2$—

EXPLANATION OF TABLE

The table presents data for over 5000 compounds. They have been selected to include those of general or commercial importance as well as those commonly met with in the laboratory.

Arrangement. The entries are arranged alphabetically by *parent compounds*, substituting atoms and groups like bromo-, chloro-, ethyl-, methyl-, nitro-, etc. being placed after the rest of the name instead of before it; e.g., Acetic acid, dichloro- (and not Dichloroacetic acid). This practice, which is followed in some of the indexes to journals, makes it possible to bring many derivatives of the same parent together. Radicals such as propyl, butyl and amyl, and also compounds such as butyric acid and valeraldehyde, are assumed to be of normal structure unless otherwise stated.

Nomenclature. Compounds are indexed under their common names wherever these are acceptable, but a large number of *synonyms* and *cross references* are included. In particular, many names formed according to the International Union Rules (see preceding pages) are given and are distinguished by the symbol (*).

An **alphabetic order of substituting radicals** is employed in each name; e.g., Ether, ethyl methyl (not Ether, methyl ethyl). For a table of radicals, see preceding pages.

Acids are entered under their "trivial" names where these exist. Systematic names are derived from trivial names where this is feasible; as, Valeric acid, α-bromo-.

Alcohols. Important alcohols having common names, as Amyl alcohol, Isoamyl alcohol, Propyl alcohol, are so entered. For others the International Union names are used; as, 3-Buten-1-ol.

Aldehydes and **amides** are usually entered under names derived from the acid name; as, Propionaldehyde, Propionamide (from propionic acid).

Amines will be found under their usual names; as, Ethylamine, Triethylamine, Ethylenediamine.

Carbylamines are entered as Ethyl isocyanide, Phenyl isocyanide, etc.

Cyanides. See Nitriles, below.

Esters of organic acids will in general be found under the names of the corresponding acids, but those of glycerol and glycol are under the names of the alcohols. Esters of inorganic acids have independent entries; as, Ethyl sulphate, Ethylsulfuric acid.

Ethers. Simple, unsubstituted ethers occur under their own names; as, Ethyl ether, Phenyl ether. Most other monoethers are under *Ether;* as, Ether, isoamyl phenyl.

Halogen derivatives of hydrocarbons, when simple, are entered under their common names (as, Propyl chloride) or, when more complex, under their International Union names (as, 1-Pentane, 2-chloro-).

Hydrazine derivatives are found under *Hydrazine* or, if monoacyl derivatives, under the name of the corresponding acid (as, Benzoic acid, hydrazide). But **hydrazones** are placed under the corresponding carbonyl compound (as, Acetone, phenylhydrazone).

Hydrocarbons of the aliphatic series are entered under their Geneva (International Union) names; other hydrocarbons, under their commonly accepted names.

Isocyanides (**Isonitriles**) are named as Ethyl isocyanide, Phenyl isocyanide, etc.

Ketones having simple names are so entered (e.g., Acetone, Acetophenone); others are given International Union names if possible (as, 2-Butanone). Those familiar with "ketone" names will find a number of cross references under *Ketone*.

Mercaptans are named, according to the International Union rule, as Ethanethiol (C_2H_5SH), Benzenethiol (C_6H_5SH), etc.

Metallic salts of organic acids will be found in the preceding table, "Physical Constants of Metal-Organic Compounds."

Metal-organic compounds should be looked for under the name of the metal; as, Lead, tetraethyl-.

Nitriles (cyanides) are given names derived from the corresponding acid; as, Acetonitrile.

Oximes are entered under the corresponding carbonyl compound; as, Formaldehyde, oxime.

Phenols will be found under their usual names; as, Phenol, Resorcinol.

Salts of bases are entered under the names of the bases; as, Aniline, hydrochloride. For metal salts of organic acids see the preceding table, "Physical Constants of Metal-Organic Compounds."

Semicarbazones are placed under the corresponding carbonyl compound; as, Acetone, semicarbazone.

Sulfides, sulfones and **sulfoxides** are treated like ethers (see Ethers, above); as, Ethyl sulfide; Sulfone, ethyl phenyl.

Sulfonic acids are named as Ethanesulfonic acid, Naphthalenedisulfonic acid, etc.

Boldface type is used to distinguish the parent compounds and their substituting radicals. When a parent compound is followed by derivatives its name is not repeated but is replaced in each succeeding entry by a dash.

Formulas. Structural formulas have been given in most cases, and the structure has been indicated as fully as is feasible without taking undue space.

Order of Data. Each entry is presented in the same invariable order: name; synonym; formula; molecular weight; color and crystalline form, index of refraction n, and specific rotation $[\alpha]$; density; melting point; boiling point; solubility.

Numbers have been assigned to all compounds for use in connection with the formula index which immediately follows the organic table. In the process of final editing (due to duplication or other causes) an occasional compound with its number has been deleted.

Crystalline form and color are stated in easily interpreted abbreviations. Other important characteristics are often added. The **index of refraction,** n, follows. For crystals of two or three indices they are invariably given in the order ω, ϵ or α, β, γ. The **specific rotation,** $[\alpha]$, is given for certain compounds. Temperature and wavelength are indicated by the superior and inferior figures and letters following the numerical value. When not otherwise indicated the index of refraction and specific rotation are understood to be at 20°C. and for sodium light.

For example: n 1.5236^{20}_{D} indicates an index of refraction of 1.5236 for sodium light (λ = 589.3 mμ) at 25°C; $[\alpha]$ $-65.6°^{20}_{D}$ indicates a negative specific rotation of 65.6° for sodium light and a temperature of 20°C.

Density, D., is normally given in grams per milliliter, at 20°C, numerically equivalent to the specific gravity at 20°C referred to water at 4°C. Specific gravity at other temperatures is shown with superior and inferior figures indicating, respectively, the temperature of the substance and that of water to which it is referred. The density of gases is given in grams per liter at 0°C and 760 mm Hg pressure unless otherwise indicated.

Example: **D.** 1.536 indicates a density in grams per milliliter at 20°C; **D.** 1.634^{25}_{4} indicates a specific gravity of 1.634 at 25°C referred to water at 4°. **D.** 2.143g/l indicates the density of a gas at standard conditions, 0°C and 760 mm pressure, as 2.143 grams per liter.

Melting point, m. p., and **boiling point, b. p.** are given in °C. Other effects of temperature elevation such as dehydration, sublimation, decomposition, explosion are recorded in connection with the melting or boiling points. Decomposition on heating is indicated by the abbreviation d. All such statements will follow the abbreviation **m. p.** or **b. p.** If decomposition occurs at a definite temperature, the form d. 120 is used, while 120 d. indicates melting or boiling with decomposition. Loss of water of crystallization is indicated by $-H_2O$. The boiling point is stated at normal atmospheric pressure (760 mm of Hg) unless otherwise indicated by a superior figure which shows the pressure in millimeters under which the compound boils at the temperature given.

Example: **b.p.** 125^{720} indicates a boiling point of 125°C at a pressure of 720 mm.

Solubility, Soly., is stated in grams of substance dissolving in 100 cm³ of the solvent. Normal room temperatures, 20°C, is assumed unless the temperature is indicated by a superior figure. The term insoluble (i.) must usually be interpreted to mean that a negligible quantity of the compound dissolves. Many compounds commonly regarded as insoluble really dissolve to a slight extent. The terms very soluble (v.s.), soluble (s.), slightly soluble (sl.s.) are used for lack of definite figures. Conflicting statements are very common in the literature. Quantitative statements of solubility are likewise subject to uncertainty due to inexact statement of conditions. Values may be variously stated as parts by weight of solute in parts by weight or volume of the solvent or of the solution, and values are often given and quoted in the literature without proper designation. In the large number of values given there are many which are uncertain in this respect.

The form s. d. indicates solubility with more or less decomposition. The occurrence of d. alone in the statement of solubility indicates that decomposition is the primary action. The statement of solubility in acids or alkalis is usually understood to be accompanied by decomposition.

The policy has been followed of giving the solubility in water, ethyl alcohol and ethyl ether first, followed by statements in regard to other solvents.

As examples:

23.4^{20}w. indicates a solubility of 23.4 grams of the substance in 100 cm³ of water at 20°C.

250 cm³ al. indicates the solubility of a gas in ethyl alcohol as 250 cm³ of the gas in 100 cm³ of alcohol.

∞^{35}w. indicates that the substance is miscible with water above 35°C.

ABBREVIATIONS

[α]	specific rotation
